

Case-Based Reasoning is ...

- A methodology to model human reasoning and thinking
- A methodology for building intelligent computer systems
- **CBR in a nutshell:**
 - store previous experience (cases) in memory
 - to solve new problems:
 - retrieve similar experience about similar situations from the memory
 - reuse the experience in the context of the new situation: complete or partial reuse, or adapt according to differences
 - store new experience in memory (learning)

A Simple Example (Overview)

Technical Diagnosis of Car Faults

- Symptoms are observed (e.g. engine doesn't start) and values are measured (e.g. battery voltage = 6.3V)
- Goal: Find the cause for the failure (e.g. battery empty) and a repair strategy (e.g. charge battery)

Case-Based Diagnosis:

- A case describes a diagnostic situation and contains:
 - description of the symptoms
 - description of the failure and the cause
 - description of a repair strategy
- Store a collection of cases in a case base
- Find case similar to current problem and reuse repair strategy

A Simple Example: What's a Case ?

- A case describes one particular diagnostic situation
- A case records several features and their specific values occurred in that situation
- A case is not a rule !!

	Feature	Value
C A S E	Problem (Symptoms)	
	<ul style="list-style-type: none">• <i>Problem:</i> Front light doesn't work• <i>Car:</i> VW Golf II, 1.6 L• <i>Year:</i> 1993• <i>Battery voltage:</i> 13,6 V• <i>State of lights:</i> OK• <i>State of light switch:</i> OK	
1	Solution	
	<ul style="list-style-type: none">• <i>Diagnosis:</i> Front light fuse defect• <i>Repair:</i> Replace front light fuse	

Compare the New Problem with Each Case and Select the Most Similar Case

- When are two cases similar?
- How to rank the cases according to their similarity?
- **Similarity is the most important concept in CBR !!**
- We can assess similarity based on the similarity of each feature
- Similarity of each feature depends on the feature **value**.
- BUT: Importance of different features may be different

A Case Base with Two Cases

- Each case describes one particular situation

All cases are independent from each other

C A S E 1	Problem (Symptoms) <ul style="list-style-type: none">• Problem: Front light doesn't work• Car: VW Golf II, 1.6 L• Year: 1993• Battery voltage: 13,6 V• State of lights: OK• State of light switch: OK
	Solution <ul style="list-style-type: none">• Diagnosis: Front light fuse defect• Repair: Replace front light fuse

C A S E 2	Problem (Symptoms) <ul style="list-style-type: none">• Problem: Front light doesn't work• Car: Audi A6• Year: 1995• Battery voltage : 12,9 V• State of lights: surface damaged• State of light switch: OK
	Solution <ul style="list-style-type: none">• Diagnosis: Bulb defect• Repair: Replace front light

Solving a New Diagnostic Problem

- A new problem must be solved
- We make several observations in the current situation
- Observations define a new problem
- Not all feature values must be known
- Note: The new problem is a case without solution part

Similarity Computation

- Assignment of similarities for features values.  
 - Express degree of similarity by a real number between 0 and 1
- Examples:

– Feature: *Problem*

Front light doesn't work $\xleftrightarrow{0.8}$ Break light doesn't work

Front light doesn't work $\xleftrightarrow{0.4}$ Engine doesn't start

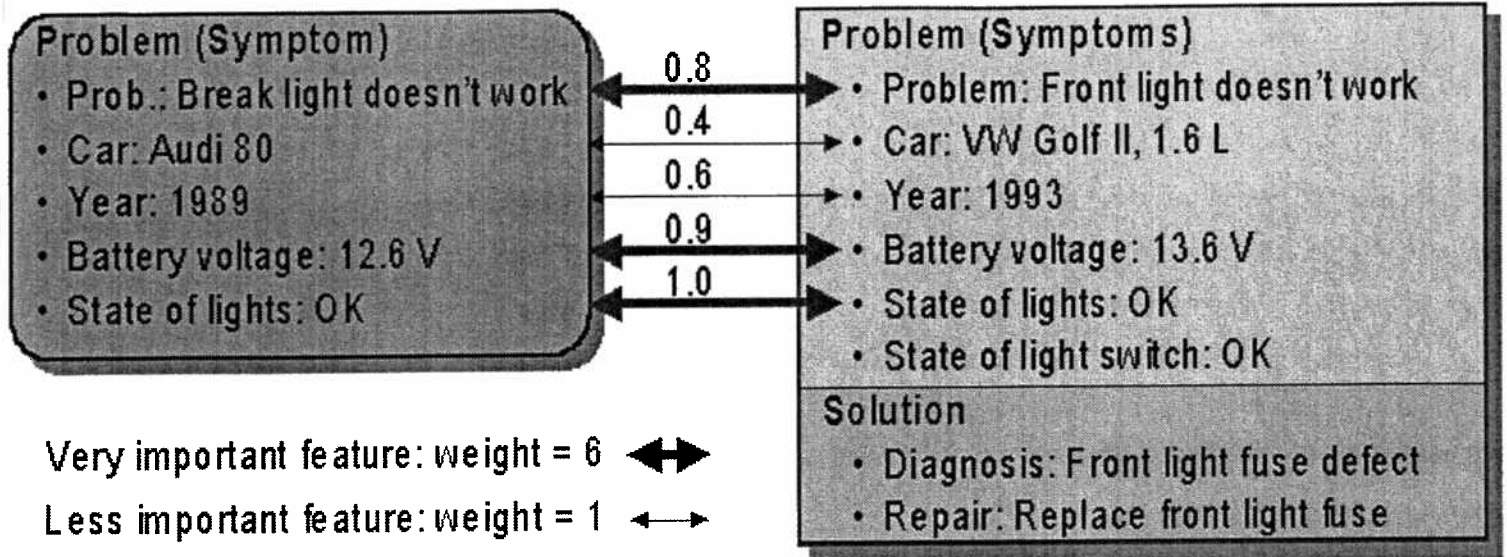

– Feature: *Battery voltage* (similarity depends on the difference)

12.6 V $\xleftrightarrow{0.9}$ 13.6 V

12.6 V $\xleftrightarrow{0.1}$ 6.7 V

- Different features have different importance (weights) !
 - High importance: Problem, Battery voltage, State of light, ...
 - Low importance: Car, Year, ...

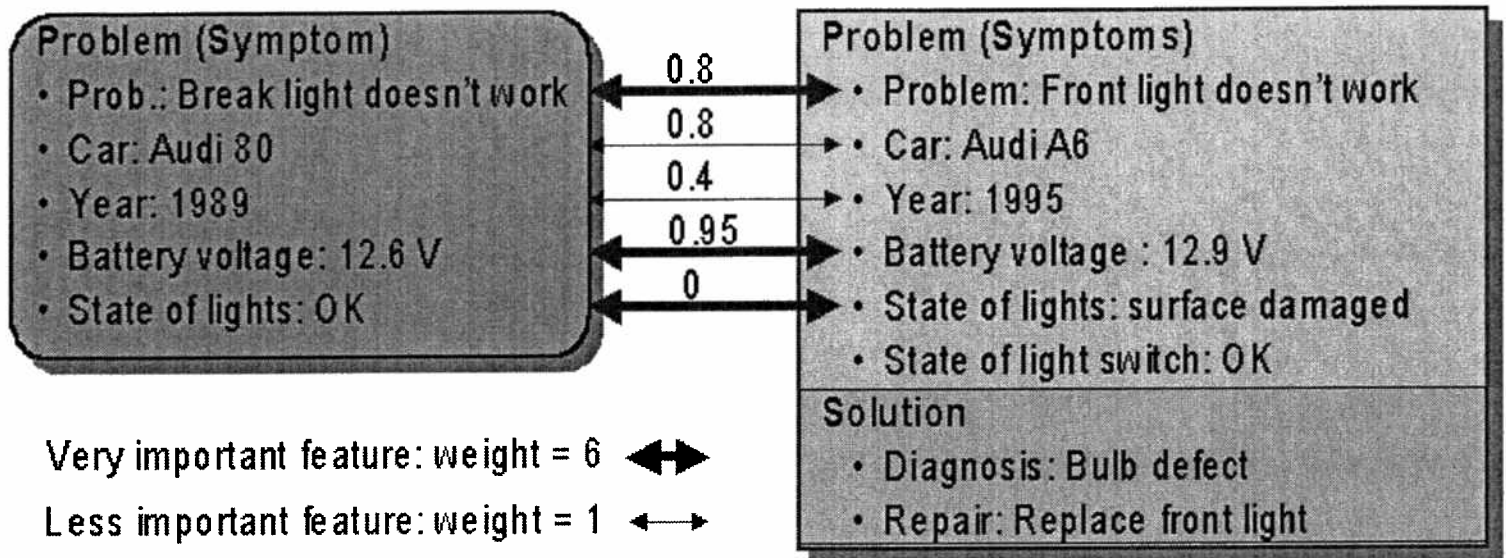

Compare New Problem and Case 1

Similarity Computation by Weighted Average

$$\text{similarity}(\text{new}, \text{case 1}) = 1/20 * [6*0.8 + 1*0.4 + 1*0.6 + 6*0.9 + 6* 1.0] = 0.86$$

Compare New Problem and Case 2

Similarity Computation by Weighted Average

$$\text{similarity}(\text{new}, \text{case 2}) = 1/20 * [6*0.8 + 1*0.8 + 1*0.4 + 6*0.95 + 6*0] = 0.585$$

Case 1 is more similar: due to feature "State of lights"

Reuse the Solution of Case 1

C A S E 1	Problem (Symptoms): <ul style="list-style-type: none">• Front light doesn't work• ...
	Solution: <ul style="list-style-type: none">• Diagnosis: Front light fuse defect• Repair: Replace front light fuse

Problem (Symptom):

- Prob.: Break light doesn't work
- Car: Audi 80
- Year: 1989
- Battery voltage: 12,6 V
- state of break light: OK

Adapt Solution:
How do differences in the problem affect the solution?

New Solution:

- Diagnosis: Break light fuse defect
- Repair: Replace break light fuse

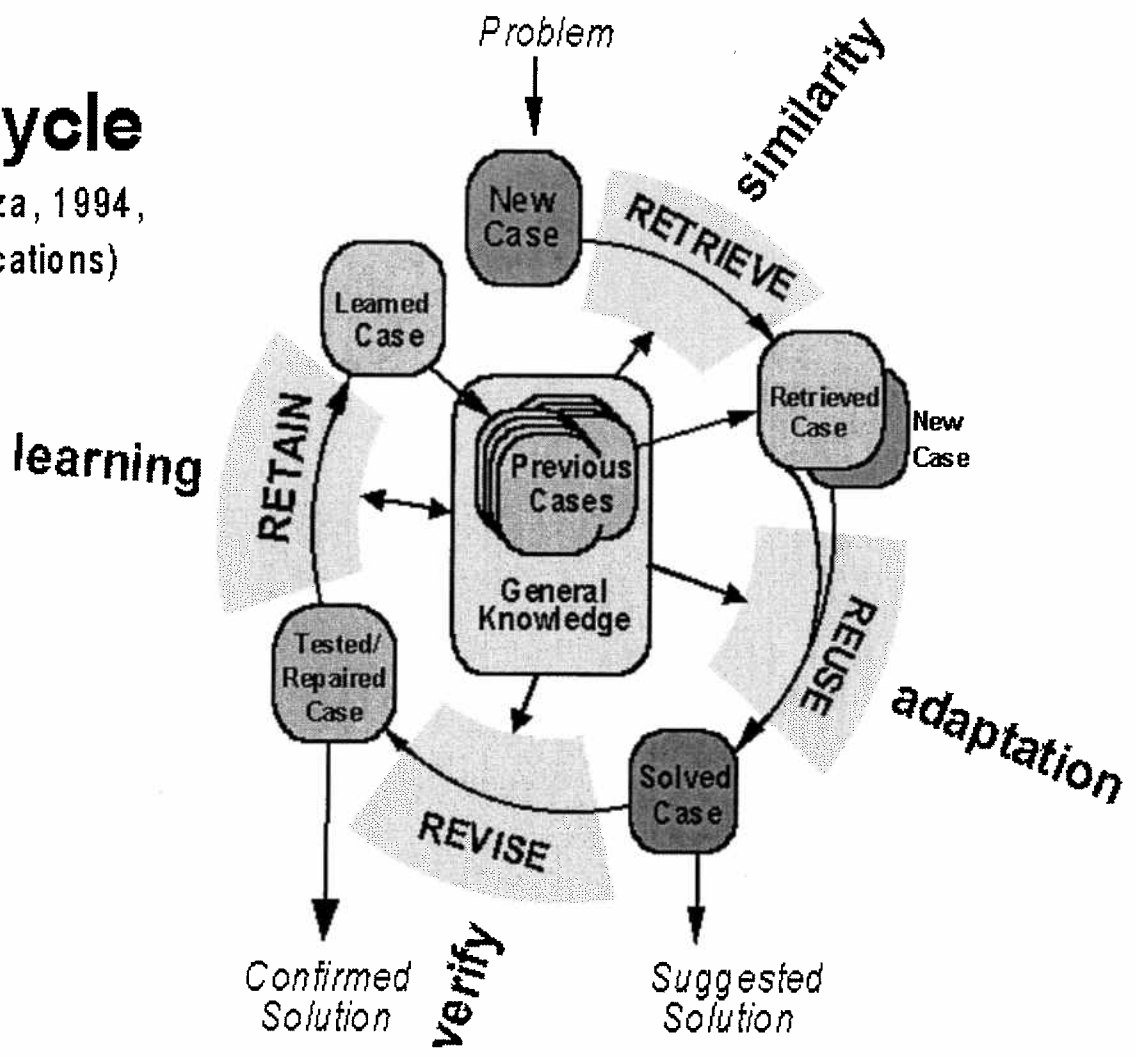

Store the New Experience

If diagnosis is correct:
store new case in the memory.

C A S E 3	Problem (Symptoms): <ul style="list-style-type: none">• Problem: Break light doesn't work• Car: Audi 80• Year: 1989• Battery voltage: 12.6 V• State of break lights: OK• light switch clicking: OK
	Solution: <ul style="list-style-type: none">• Diagnosis: break light fuse defect• Repair: replace break light fuse

CBR Cycle

(Aamodt & Plaza, 1994, AI Communications)

Summary

- CBR is a technique for solving problems based on experience
- CBR problem solving involves four phases:
Retrieve, Reuse, Revise, Retain
- CBR systems store knowledge in four containers:
Vocabulary , Case Base , Similarity Assessment, Solution Adaptation

Retain: Learning from Problem Solving

- **What can be learned:**
 - New experience (new case)
 - Improved similarity assessment, importance of features
 - Organization/indexing of the case base to improve efficiency
 - Knowledge for solution adaptation
 - Forgetting cases, e.g., for efficiency or because out-of-date
- **Methods**
 - Storing cases in the case base
 - Deleting cases from the case base
 - Explanation-based learning
 - Induction, e.g. of decision trees
 - Neural net style learning

Less Effort Required for Maintenance

What is the impact of changes of the environment ?

- **Rule bases or models are difficult to maintain**
 - Many dependencies between rules
 - Rules of KBS often difficult to understand for non AI experts
 - Effects of changes of the rule base are hard to predict
 - Maintenance by the domain expert impossible !!
- **Case bases are easier to maintain**
 - Cases are independent from each other
 - Domain experts and novices understand cases quite easy
 - Maintenance of the CBR system (partially) by adding/deleting cases
 - However, changes in the vocabulary container require (little) more effort
