

# CSSE463: Image Recognition

Day 3

- Announcements/reminders:
  - Lab 1 should have been turned in last night.
  - Tomorrow: Lab 2 (posted): on color images. **Bring laptop.**
- Today:
  - Introduce **Fruit Finder**, due **next Friday**.
  - Lots of Helpful hints in Matlab.
  - Connected components and morphology
- Next week: Edge features
- Questions?

# Project 1: Counting Fruit

- How many apples? Bananas? Oranges?

# Goals

- Crash-course in using and applying Matlab
  - For this reason, I will direct you to some useful functions, but will not give details of all of them
- Practice feature extraction
- Practice writing a conference-paper style report
  - Could use style similar to ICME sunset paper

# Fruit-finding technique

- Observe
  - What *is* a banana's "yellow" (numerically)?
  - Tomorrow in lab, we'll see techniques
- Model
  - Can you differentiate between yellow and orange? Orange and red? (Decisions)
  - Note: this isn't using a classifier yet; just our best guess at hand-tuned boundaries
- Classify pixels using your model
- "Clean up" the results
  - Discuss today
- Write up your results in a nice report (nice to do as you go)

# Region processing

- Binary image analysis
  - Today, we'll only consider binary images composed of *foreground* and *background* regions
    - Example: apple and non-apple
    - Use find to create a mask of which pixels belong to each

# Matlab How-to

- Lots of “Random” tidbits that I used in my solution:
  - zeros
  - size
  - find

# Functions in Matlab

Contents of foo.m:

```
function retVal = dumbSum(x,y)
```

```
...
```

```
retVal = x+y;
```

Note that there is no **return** keyword.

Can return multiple values of any type:

```
[mask, count, threshold] = foo(img)
```

# Neighborhoods

- Do we consider diagonals or not?
- 4-neighborhood of pixel  $p$ :
  - Consists of pixels in the 4 primary compass directions from  $p$ .
- 8-neighborhood of pixel  $p$ :
  - Adds 4 pixels in the 4 secondary compass directions from  $p$ .

# Connected Components

- Goal: to label groups of connected pixels.
  - Assign each block of foreground pixels a unique integer
  - 4-connectivity vs. 8-connectivity matters
- Matlab help: search for *connected components*, and use *bwlabel* function
- Demo
- You'll likely devise an algorithm to do this as part of week 3 homework.

# Process

# Morphological operations (Sonka, ch 13)

- Morphology = form and structure (shape)
- For binary images
  - Done via a structuring element (usually a rectangle or circle)
- Basic operations:
  - Dilation, erosion, closing, opening

# Dilation

- Given a structuring element, adds points in the union of the structuring element and the mask
- Intuition: Adds background pixels adjacent to the boundary of the foreground region to the foreground.
- Def:

$$X \oplus B = \{ p \in \mathcal{E}^2 : p = x + b, x \in X \text{ and } b \in B \}$$

# Dilation in action

Strel = 2x1,  
centered on dot

# Dilation

- Matlab: `imdilate(bw, structureElt)`
  - `structureElt` (for 8 neighborhood) found by:
    - `structureElt = strel('square', 3);` % for erosion using 3x3 neighborhood
  - `structureElt` (for 4 neighborhood) found by:
    - `structureElt = strel([0 1 0; 1 1 1; 0 1 0]);`
  - `help strel` lists 11 others

- Demo for intuition: Enlarges a region

- Def:

$$X \oplus B = \{ p \in \mathcal{E}^2 : p = x + b, x \in X \text{ and } b \in B \}$$

# Erosion

- Removes all pixels on the boundary
- Matlab: `imerode(bw, structureElt)`

$$X \ominus B = \{ p \in \mathcal{E}^2 : p = x + b \in X \forall b \in B \}$$

# Closing and Opening

- Closing (imclose)
  - Dilate, then erode
  - Fills internal holes in a region, while maintaining approximate pixel count
  - Eliminates inlets on the boundary
- Opening (imopen)
  - erode, then dilate
  - Removes small regions
  - Eliminates peninsulas on the boundary
- To make dilation more aggressive,
  - Dilate  $n$  times, then erode  $n$  times.
  - Or, use a larger structuring element
  - Example: compare *dilating twice using a 3x3 square* with *dilating once using a 5x5 square*.
