ECE 300
Signals and Systems
Homework 6

Due Date: Tuesday April 22, 2008 at the beginning of class

Exam 2, Thursday April 24, 2008

**No Lab Next Week**

Problems:

1. Assume $x(t)$, which has a fundamental period of 2 seconds, has the following spectrum (all phases are multiples of 45

degrees)

a) What is $x(t)$? Your expression must be real.

b) What is the average value of $x(t)$?

c) What is the average power in $x(t)$?

Spring 2008

2. Assume $x(t)$ has the spectrum shown below (the phase is shown in radians) and a fundamental frequency $\omega_o = 2$ rad/sec :
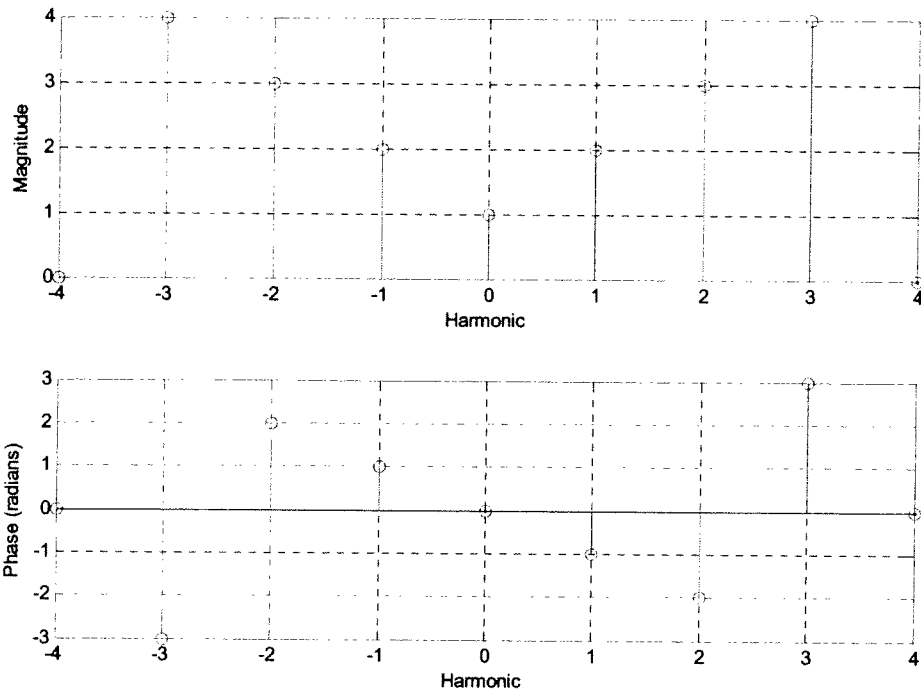

Assume $x(t)$ is the input to a system with the transfer function

$$H(\omega) = \begin{cases} e^{-j\omega} & 1 \le |\omega| < 3 \\ 2e^{-j2\omega} & 3 < |\omega| < 5 \\ 0 & else \end{cases}$$

Determine an expression for the steady state output $y(t)$. Be as specific as possible, simplifying all values and using actual numbers wherever possible.

3. ZTM, Problem 3-16.

4. A periodic signal $x(t)$ is the input to an LTI system with output $y(t)$. The signal $x(t)$ has period 2 seconds, and is given over one period as

$$x(t) = e^{-t} \quad 0 < t < 2$$

$x(t)$ has the Fourier series representation

$$x(t) = \sum_k \frac{0.4323}{1 + jk\pi} e^{jk\pi t}$$

The system is an ideal highpass filter that eliminates all signals with frequency content less than 0.75 Hz.

a) Find the average power in $x(t)$.

b) Determine an expression for the output, $y(t)$. Your expression for $y(t)$ must be real.

(*Answer:* $y(t) = e^{-t} - 0.4323 - 0.2622 \cos(\pi t - 1.2626)$)

c) Determine the average power in $y(t)$.

d) What fraction of the average power in $x(t)$ is contained in the DC and fundamental frequency components?

5. Assume $x(t) = t^2 \quad -\pi \le t \le \pi$ with Fourier Series representation

$$x(t) = \sum_k X_k e^{jkt}$$

where

$$X_k = \begin{cases} \dfrac{\pi^2}{3} & k = 0 \\[2ex] \dfrac{2(-1)^k}{k^2} & k \ne 0 \end{cases}$$

a) Assume $x(t)$ is the input to a system that eliminates all signals with frequencies outside the range 0.5 to 0.7 Hz. What is the output of the system $y(t)$ and what fraction of the average power in $x(t)$ is in $y(t)$? (Note: your answers must be real, no e^{ja} terms.)

b) Assume $x(t)$ is the input to a system that eliminates all signals with frequencies in the range 0.5 to 0.7 Hz. What is the output of the system $y(t)$ and what fraction of the average power in $x(t)$ is in $y(t)$?

6. Assume two periodic signals have the Fourier series representations

$$x(t) = \sum X_k e^{jk\omega_o t} \quad y(t) = \sum Y_k e^{jk\omega_o t}$$

For the following system (input/output) relationships:

a) $y(t) = bx(t-a)$

b) $y(t) = b\dot{x}(t-a)$

c) $y(t) = bx(t)\cos(\omega_o t)$ **(Answer:** $Y_n = \dfrac{b}{2}\left(X_{n-1} + X_{n+1}\right)$**)**

d) $\ddot{y}(t) + \dfrac{2\varsigma}{\omega_n}\dot{y}(t) + \dfrac{1}{\omega_n^2}y(t) = Kx(t)$

i) write Y_k in terms of the X_k

ii) If possible, determine the system transfer function $H(j\omega)$

iii) A system must be both linear and time-invariant to have a transfer function. If you cannot determine the transfer function, indicate which system property is not satisfied (**L** or **TI**).

7. Most microcontrollers are capable of generating pulse width modulation (PWM) signals on one or more output pins. These signals are square waves where both the period and the duty cycle can be programmed in the microcontroller by the use of timers and different reference clocks. These PWM output signals can then be used in conjunction with lowpass filters to produce reasonable approximations to analog output signals. In this problem we will use what we have learned in the course to investigate how to do this. The signal $v(t)$ below is a PWM signal, shown for about one and a half periods. The signal has period T_0, amplitude V (usually fixed at 5 or 3.3 volts), pulse duration τ, and duty cycle $D = \dfrac{\tau}{T_0}$.
The Fourier series representation is $v(t) = \sum_{k=-\infty}^{k=\infty} e^{-\frac{jk\pi\tau}{T_0}} \left(\frac{V\tau}{T_0}\right) \text{sinc}\left(\frac{k\tau}{T_0}\right) e^{jk\omega_0 t}$

a) For the periodic signal $v(t)$, determine an expression for the **average power** in the periodic signal in terms of T_0, τ, and V. Your answer must contain no sums or integrals.

b) Determine an expression for the **average value** of $v(t)$ in terms of T_0, τ, and V.

c) It is the average value of $v(t)$ that we want to use as our analog output. Hence we need to design a lowpass filter that allows us to keep our DC term, and, ideally, remove all of the other harmonics. Let's assume we want to use a simple first order RC lowpass filter with transfer function

$$H(j\omega) = \frac{1}{j\omega RC + 1} = \frac{1}{j\omega\frac{\sqrt{\alpha}}{\omega_0} + 1}$$

where we have set $RC = \frac{\sqrt{\alpha}}{\omega_0}$ for convenience.

Determine the value of α so that the average power in the first harmonic of the output signal is 20 dB lower than the average power in the DC component the output signal.
Assume here that the fundamental frequency is $f_0 = 100\,Hz$, the duty cycle is $\frac{\tau}{T_0} = 0.8$, and $V = 5.0\,\text{volts}$.

d) For your value of α determined in part **c** and the parameter values given in part **c**, determine an expression for the first two terms (the DC and first harmonic) in the Fourier series representation of the output signal.
(Answer: $y(t) \approx 4 + 0.566\cos(2\pi 100t - 3.77)$)

e) For your value of α determined in part **c**, and the parameter values given in part **c**, determine the **bandwidth** of the filter you designed. Be sure to include units!
Spring 2008

(#1) See Spectrum Below

(a) $x(t) = C_0^x + 2|C_1^x| \cos(\omega_0 t + \angle C_1^x) + 2|C_2^x| \cos(2\omega_0 t + \angle C_2^x)$

$$\boxed{x(t) = -3 + 4\cos(\pi t - 90°) + 2\cos(2\pi t + 45°)}$$

$T_0 = 2 \quad \omega_0 = \frac{2\pi}{T_0} = \frac{2\pi}{2} = \pi$

(b) $\boxed{\bar{x} = C_0^x = -3}$

(c) $P_{ave}^x = \sum |C_k|^2 = 1^2 + 2^2 + 3^2 + 2^2 + 1^2 = 2 + 8 + 9 = 19$

(#2) $H(\omega) = \begin{cases} e^{-j\omega} & 1 \le |\omega| < 3 \\ 2e^{-j2\omega} & 3 < |\omega| \le 5 \\ 0 & else \end{cases}$ $\omega_0 = 2\,rad/sec$

$Y_0 = X_0 H(0) = 0$

$Y_1 = X_1 H(|\omega_0) = (2e^{-j1})(e^{-j2}) = 2e^{-j3} = 2\,\angle{-3}\,rad$

$Y_2 = X_2 H(2\omega_0) = (3e^{-j2})(2e^{-j8}) = 6e^{-j10} = 2\,\angle{-10}\,rad$

$Y_3 = X_3 H(3\omega_0) = 0$

$y(t) = Y_0 + 2|Y_1|\cos(\omega_0 t + \angle Y_1) + 2|Y_2|\cos(2\omega_0 t + \angle Y_2) + 0 + \cdots$

$\boxed{y(t) = 4\cos(2t-3) + 12\cos(4t-10)}$

(#3) ZTF Problem 3-16 $x(t) = \sum x_n e^{jn\omega_0 t}$ $x_n = \frac{1}{T_0}\int_{T_0} x(t)e^{-jn\omega_0 t}dt$

a) assume $x(t)$ is real and even

$$x_n = \frac{1}{T_0}\int_{-T_0/2}^{T_0/2} x(t)\left[\cos(n\omega_0 t) - j\sin(n\omega_0 t)\right]dt$$

$$= \frac{1}{T_0}\int_{-T_0/2}^{T_0/2} x(t)\cos(n\omega_0 t)dt - j\frac{1}{T_0}\int_{-\frac{T_0}{2}}^{T_0/2} \underbrace{\underbrace{x(t)}_{even}\underbrace{\sin(n\omega_0 t)}_{odd}}_{\text{product is odd}}dt$$

$$\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} \text{odd function} = 0$$

So $x_n = \frac{1}{T_0}\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} x(t)\cos(n\omega_0 t)dt$

$$x_{-n} = \frac{1}{T_0}\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} x(t)\cos(-n\omega_0 t)dt = x_n \quad \text{(cosine is even)}$$

Since $x(t)$ is **real** and even we have $\boxed{x_n \text{ is real and even}}$

b) assume $x(t)$ is real and odd

Then by the above arguments, $x_n = \frac{-j}{T_0}\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} x(t)\sin(n\omega_0 t)dt$

$$x_{-n} = \frac{-j}{T_0}\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} x(t)\sin(-n\omega_0 t)dt = \frac{j}{T_0}\int_{-\frac{T_0}{2}}^{\frac{T_0}{2}} x(t)\sin(n\omega_0 t)dt = -x_n$$

since $x(t)$ is real and odd, $\boxed{x_n \text{ is purely imaginary and odd}}$

c) assume $x(t) = -x(t \pm \frac{T_0}{2})$ (half wave symmetry)

$$x(t) = \sum x_n e^{jn\omega_0 t} = -x(t+\frac{T_0}{2}) = -\sum x_n e^{jn\omega_0(t + T_0/2)}$$

$$= -\sum x_n e^{jn\omega_0 t} e^{jn(\omega_0 T_0)/2} = \underset{\uparrow}{-e^{j\pi}}\sum x_n e^{jn\omega_0 t}e^{jn\pi}$$

$$= \sum x_n e^{jn\omega_0 t} e^{j(n+1)\pi} = \sum x_n e^{jn\omega_0 t} = x(t)$$

This will only happen if $x_n = 0$ for n even

(#4) $x(t) = e^{-t}$ $0 \le t \le 2$ $T_0 = 2$ $f_0 = \frac{1}{2} = 0.5 Hz$

$$x(t) = \sum_{K=-\infty}^{\infty} \frac{0.4323}{1+jK\pi} e^{jK\pi t}$$

a) $P_{ave}^{x} = \frac{1}{T_0} \int_{T_0} |x(t)|^2 dt = \frac{1}{2} \int_{0}^{2} e^{-2t} dt = \frac{1}{2} \left. \frac{e^{-2t}}{-2} \right|_{0}^{2} = \frac{1}{4}\left(1-e^{-4}\right) = 0.2454$

$$\boxed{P_{ave}^{x} = 0.2454}$$

b) The high pass filter removes signals with frequency content below 0.75 Hz. Let's figure out what they are

It removes $K=0, K=\pm 1$

$C_0^x = 0.4323$

$C_1^x = \frac{0.4323}{1+j\pi} = 0.13112 \measuredangle 1.2626$ rad

$y(t) = e^{-t} - 0.4323 - 2(0.13112)\cos(\pi t - 1.2626)$

$$\boxed{y(t) = e^{-t} - 0.4323 - 0.26225\cos(\pi t - 1.2626)}$$

c) $P_{ave}^{y} = P_{ave}^{x} - |c_0^x|^2 - 2|c_1^x|^2 = 0.2454 - (0.4323)^2 - 2(0.13112)^2$

$$\boxed{P_{ave}^{y} = 0.02413}$$

d) $\dfrac{|c_0^x|^2 + 2|c_1^x|^2}{P_x^{ave}} = \dfrac{(0.4323)^2 + 2(0.13112)^2}{0.2454} = 0.90166 \approx \boxed{90\%}$

(#5) $x(t) = t^2 \quad -\pi \le t \le \pi$

$$x(t) = \sum x_K e^{jKt} \qquad x_K = \begin{cases} \dfrac{\pi^2}{3} & K = 0 \\[2mm] \dfrac{2(-1)^K}{K^2} & K \ne 0 \end{cases}$$

a) Bandpass filter, removes everything outside range 0.5 to 0.7 Hz

$$\omega_0 = 1 \text{ rad/sec} = 2\pi f_0 \qquad f_0 = \tfrac{1}{2\pi} = 0.159 \text{ Hz}$$

K	$f = K f_0$
0	0
1	0.159
2	0.318
3	0.477
4	0.636 — only term
5	0.795

$$y(t) = 2|c_4^x| \cos(4\omega_0 t + \angle c_4^x)$$

$$c_4^x = \frac{2(-1)^4}{4^2} = \frac{2}{16} \angle 0° = \frac{1}{8} \angle 0° = 0.125 \angle 0°$$

$$\boxed{y(t) = 0.25 \cos(4t)}$$

$$P_{ave}^x = \frac{1}{2\pi} \int_{-\pi}^{\pi} |x(t)|^2 dt = \frac{1}{2\pi} \int_{-\pi}^{\pi} t^4 dt = \frac{1}{2\pi} \frac{t^5}{5}\Big|_{-\pi}^{\pi} = \frac{2(\pi^5)}{5(2\pi)} = 19.48$$

$$\frac{2|c_4^x|^2}{P_{ave}^x} = \frac{2|0.125|^2}{19.48} \times 100\% = 0.16\% \text{ of total power}$$

b) $y(t) = t^2 - 0.25 \cos(4t)$

$$\frac{P_{ave}^y}{P_{ave}^x} = 100\% - 0.16\% = \boxed{99.84\%}$$

(#6) $\quad x(t) = \sum X_k e^{jkw_0 t} \qquad y(t) = \sum Y_k e^{jkw_0 t}$

a) $y(t) = b x(t-a)$

$$\sum Y_k e^{jkw_0 t} = b \sum X_k e^{jkw_0(t-a)} = \sum b X_k e^{-jkw_0 a} e^{jkw_0 t}$$

$$\boxed{Y_k = X_k b e^{-jkw_0 a} \qquad H(jw) = b e^{-jwa}}$$

b) $y(t) = b \dot{x}(t-a)$

$$\sum Y_k e^{jkw_0 t} = \frac{d}{dt} \sum b e^{-jkw_0 a} X_k e^{jkw_0 t}$$

$$= \sum b e^{-jkw_0 a} jkw_0 X_k e^{jkw_0 t}$$

$$\boxed{Y_k = b e^{-jkw_0 a} jkw_0 X_k \qquad H(jw) = bjw e^{-jwa}}$$

c) $y(t) = b x(t) \cos(w_0 t)$

$$Y_k = \frac{1}{T_0} \int_{T_0} y(t) e^{-jkw_0 t} dt$$

$$= \frac{1}{T_0} \int_{T_0} b x(t) \cos(w_0 t) e^{-jkw_0 t} dt$$

$$= \frac{1}{T_0} \int_{T_0} b x(t) \left[\frac{e^{jw_0 t}}{2} + \frac{e^{-jw_0 t}}{2} \right] e^{-jkw_0 t} dt$$

$$= \frac{b}{2} \left[\frac{1}{T_0} \int_{T_0} x(t) e^{-j(k-1)w_0 t} dt + \frac{1}{T_0} \int_{T_0} x(t) e^{-j(k+1)w_0 t} dt \right]$$
$$\boxed{Y_k = \frac{b}{2} \left[X_{k-1} + X_{k+1} \right]} \qquad \text{(not TI)}$$

d) $\ddot{y}(t) + \frac{2\xi}{w_n} \dot{y}(t) + \frac{1}{w_n^2} y(t) = K x(t)$

$$\sum Y_k (jkw_0)^2 e^{jkw_0 t} + \sum Y_k \frac{2\xi}{w_n}(jkw_0) e^{jkw_0 t} + \sum Y_k \frac{1}{w_n^2} e^{jkw_0 t} = \sum X_k K e^{jkw_0 t}$$

$$\boxed{Y_k = \frac{K}{(jkw_0)^2 + \frac{2\xi}{w_n}(jkw_0) + \frac{1}{w_n^2}} X_k \qquad H(jw) = \frac{K}{(jw)^2 + \frac{2\xi}{w_n}(jw) + \frac{1}{w_n^2}}}$$

$V(t)$

$$V(t) = \sum_{k=-\infty}^{\infty} e^{-j\frac{k\pi\tau}{T_0}} \left(\frac{V\tau}{T_0}\right) \operatorname{sinc}\left(\frac{k\tau}{T_0}\right) e^{jkw_0 t}$$

a) $P_{ave}^V = \frac{1}{T_0} \int_{T_0} |V(t)|^2 dt = \frac{1}{T_0} \int_0^\tau V^2 dt = \boxed{V^2 \frac{\tau}{T_0} = P_{ave}^V}$

b) $C_0^V = e^{-j\frac{k\pi\tau}{T_0}} \left(\frac{V\tau}{T_0}\right) \operatorname{sinc}\left(\frac{k\tau}{T_0}\right) \Big|_{k=0} = \boxed{\frac{V\tau}{T_0} = C_0^V = V_{ave}}$

c) $V(t) \longrightarrow \boxed{H(jw)} \longrightarrow y(t)$

$P_Y^1 = 2|c_1^Y|^2 \qquad P_Y^0 = |c_0^Y|^2$

$20\,dB = 10\log_{10}\left(\frac{|c_0^Y|^2}{2|c_1^Y|^2}\right)$

$2 = \log_{10}\left(\frac{|c_0^Y|^2}{2|c_1^Y|^2}\right)$

$\frac{|c_0^Y|^2}{2|c_1^Y|^2} = 10^2 = 100$

$|c_0^Y|^2 = 200|c_1^Y|^2 \qquad \text{or} \qquad |c_1^Y|^2 = \frac{1}{200}|c_0^Y|^2$

$c_0^Y = c_0^V H(0) = \left(\frac{V\tau}{T_0}\right)(1) = 5(0.8)(1) = 4.0$

$|c_1^Y| = |c_1^V H(jw_0)| = |c_1^V||H(jw_0)|$

$|H(jw_0)| = \left|\frac{1}{1+j\sqrt{\alpha}}\right| = \frac{1}{\sqrt{1+\alpha}}$

$|c_1^V| = \left|\frac{V\tau}{T_0}\right|\left|\operatorname{sinc}\left(\frac{\tau}{T_0}\right)\right| = (4)(\operatorname{sinc}(0.8)) = 4\frac{\sin(\pi(0.8))}{\pi(0.8)} = 0.9355$

$|c_1^Y| = \frac{0.9355}{\sqrt{1+\alpha}}$

#7 (continued)

$$|c_1^y|^2 = \frac{1}{200} |c_0^y|^2$$

$$\frac{(0.9355)^2}{(1+\alpha)} = \frac{1}{200} (4)^2 = \frac{16}{200} \qquad \left(\frac{200}{16}\right)(0.9355)^2 = 1 + \alpha$$

$$\boxed{\alpha = 9.94}$$

(d) $c_0^y = 4$

$$c_1^y = c_1^v \, H(j\omega_0) = e^{-j\pi \tau/T_0} \left(\frac{V\tau}{T_0}\right) \text{sinc}\left(\frac{\tau}{T_0}\right) \frac{1}{1+j\sqrt{\alpha}}$$

$$= e^{-j0.8\pi} (0.9355) \frac{1}{1+j\sqrt{9.94}}$$

$$|c_1^y| = 0.2828$$

$$2|c_1^y| = 0.566$$

$$\angle c_1^y = -0.8\pi - 1.26365 = -3.777$$

$$y(t) \approx c_0^y + 2|c_1^y| \cos(\omega_0 t + \angle c_1^y)$$

$$\boxed{y(t) \approx 4 + 0.566 \cos(2\pi \cdot 100 t - 3.77)}$$

(e) $\alpha = 9.94 \qquad \sqrt{\alpha} = 3.153$

$$H(j\omega) = \frac{1}{j\omega \frac{\sqrt{\alpha}}{\omega_0} + 1} = \frac{1}{j\omega \frac{(3.153)}{2\pi \cdot 100} + 1} = \frac{1}{j\omega (0.00502) + 1}$$

$$\approx \frac{1}{j\omega \frac{1}{199.3} + 1} \qquad \boxed{\text{Bandwidth} \approx 199.3 \text{ rad/sec} \quad \text{or } 31.7 \text{ Hz}}$$
