ECE 350 Lab Project 9 May 11, 2004

Lab Practical
no written report will be required

Practical exam

You may construct any of the following circuits – individual work only. Lab partners may NOT select the same experiment for the lab practical. I will discuss the circuit with you and review testing analysis and procedures. You will also be asked to demonstrate the use of related test equipment. I expect the exam to take under 10 minutes for most cases so please be sure to have your circuit functioning prior to asking to be checked. A sign up sheet will be available in lab on 5/12 so you may decide which hour you need to arrive at the lab.

The lab period on May 12 will be available to review questions/problems you have/had with the options listed below. I will be available to answer questions and assist but I will not give the lab practical until next week. The lab on May 12 is basically to provide you an opportunity to get help before you are actually evaluated.

Available circuits to use for the lab practical:

- Lab 2, experiment 3
- Lab 3, experiment 2
- Lab 4, experiment 1 but include automatic reference voltage circuitry
- Lab 5, but use a 4 resistor bias instead of the current source bias
- Lab 7, design 2 or design 3
