

CSSE 220

Intro to Java Graphics

Check out `IntroToJavaGraphics` from SVN

Announcement

- Exam 1 Starts Wednesday
- We're splitting the exam into written and programming and doing them on separate days
- Before Monday's class
 - Print out and complete the written portion of the 201710 written exam (provided on the schedule page)
 - Bring any questions you have to Monday's class
 - Be sure to time yourself to make sure you can complete it within the given 50 minutes

Simple Graphics

JAVA GRAPHICS

Simplest Java Graphics Program

```
import javax.swing.JFrame;
/**
 * From Ch 2, Big Java.
 * @author Cay Horstmann
 */
public class EmptyFrameViewer {
    /**
     * Draws a frame.
     * @param args ignored
     */
    public static void main(String[] args) {
        JFrame frame = new JFrame();
        frame.setSize(300,400);
        frame.setTitle("An Empty Frame");
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setVisible(true);
    }
}
```

This code is already in your project for today

Creates a graphics frame object

Configures it

Display the frame

Tells Java to exit program when user closes the frame

MyViewer and **MyComponent** (Based on **RectangleViewer** and **RectangleComponent** from Big Java)

LIVE CODING

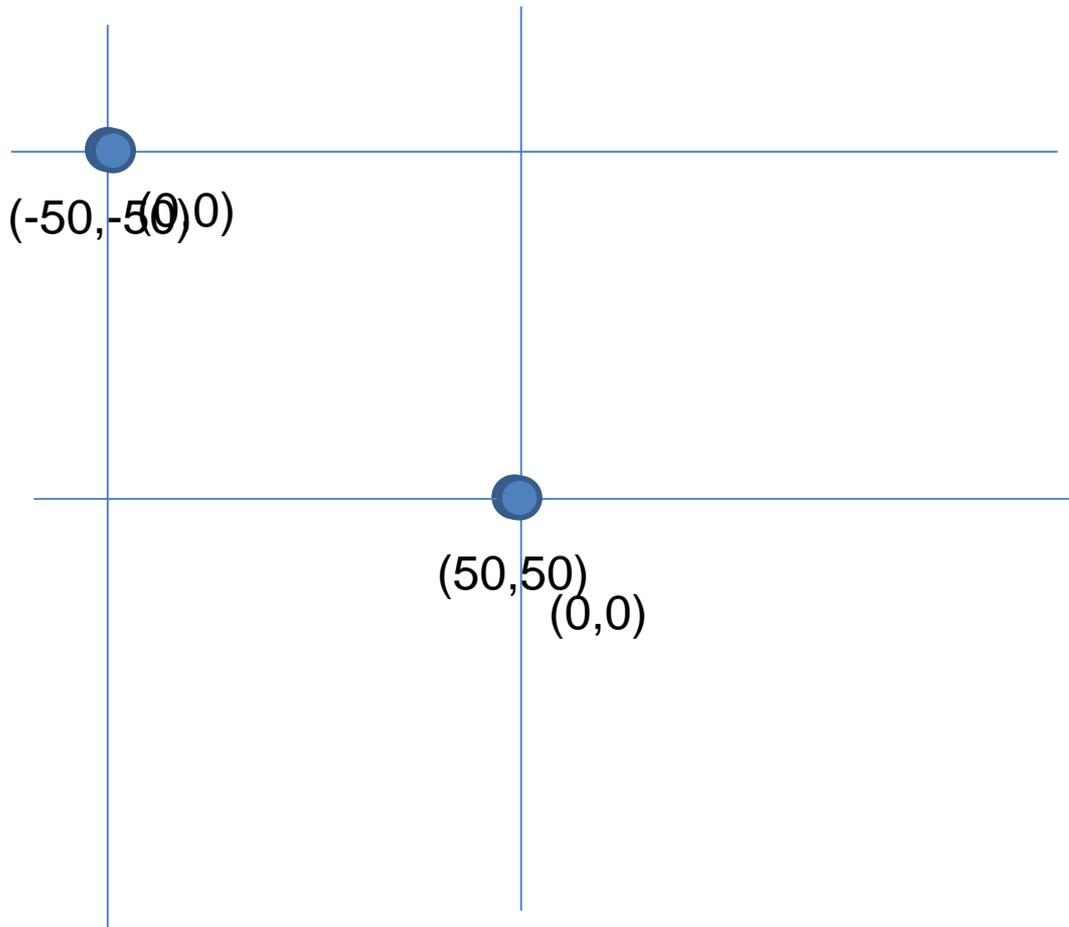

Other Shapes

- `new Ellipse2D.Double(double x, double y,
double w, double h)`
- `new Line2D.Double(double x1, double y1,
double x2, double y2)`
- `new Point2D.Double(double x, double y)`
- `new Line2D.Double(Point2D p1, Point2D p2)`
- `new Arc2D.Double(double x, double y,
double w, double h,
double start, double extent,
int type)`
- `new Polygon(int[] x, int[] y, int nPoints);`
- Try some of these!
 - Add an ellipse and both kinds of lines to `MyComponent`

Using translate and rotate successfully

- Translate and rotate to adjust the “state” of the pen
- It is usually easier to move the pen, then draw in a fixed configuration around (0,0), then move the pen back
- Make (0,0) your center of rotation
 - can change the point of origin using `translate()` so you can rotate different portions of the component

Translate

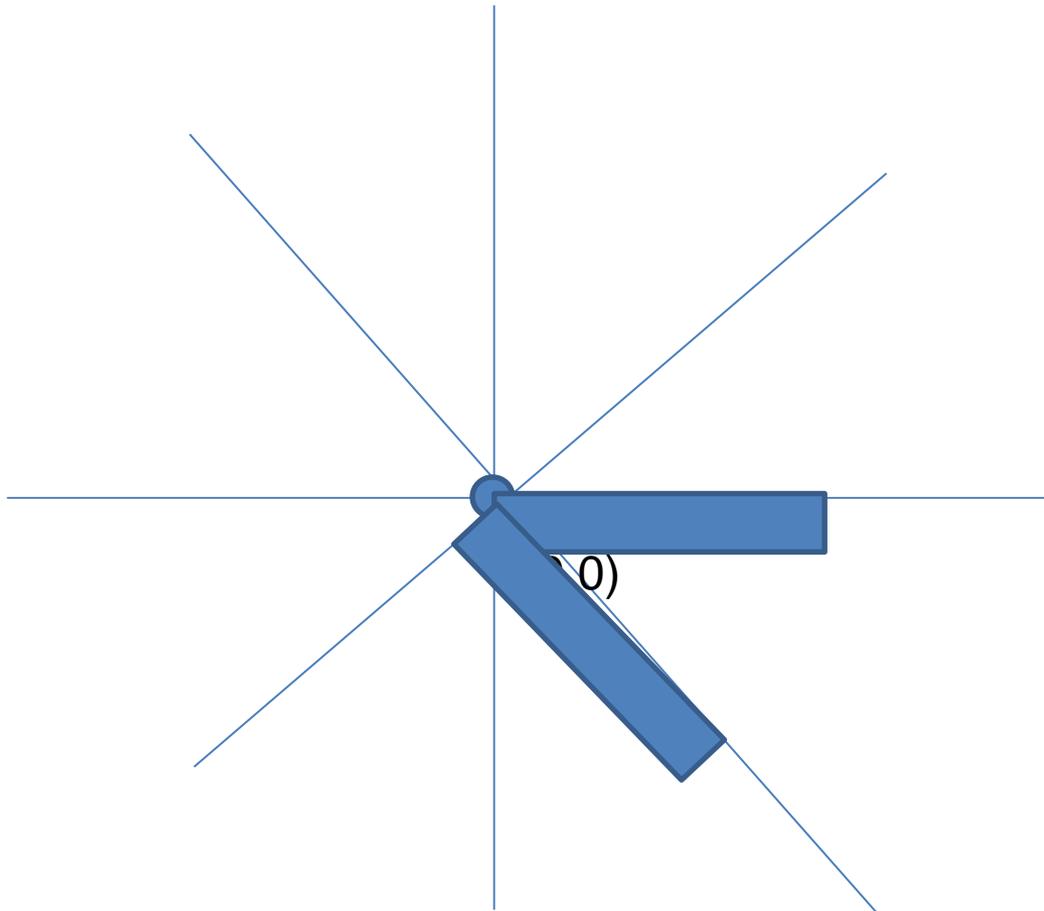

Originally, origin of 0,0
at top left of screen (with (50,50)
marked below)

If we called `g2.translate(50, 50)`,
here's what would happen:

Always want to make sure we
reset the pen, so when we're done,
we need to translate back to where
we started, in this case:
`g2.translate(-50,-50)`

Rotate

Let's say we've already translated to put the origin at (50,50) (mostly to make the slides look nicer)

If we drew a rectangle here like this:

`g2.drawRect(0, 0, 50, 10);`, we would get something like...

What would happen if we called `g2.rotate(Math.PI/4);` (radians) then call `g2.drawRect(0, 0, 50, 10);` again?

Remember, y is positive down instead of up, so the rotate will go reverse of what you might be expecting

Work

- Work on the 3 todos in the translationrotation package (TranslateComponent, RotateComponent)
- Then solve the HourTimer Problem
- Details are in the PDF within your repo
