1A. An object weighs 960 lb_f on the surface of the earth where the acceleration of gravity is 30.0 ft/sec^2 .

- What is its mass in slugs?
- What is its mass in lb_m ?

1B. A 100 kg batch mixture is made up of compounds A and B. The mass fractions are 0.7 and 0.3 respectively. You are given that the molar mass of A, M_A , is 36.0 and the molar mass of B, M_B , is 52.0 .

- What are the molar fractions of A and B?
- What is the equivalent or overall molar mass of the mixture?

1C. An incompressible fluid flows through a duct, which is 0.6 m high and 1.0 m wide. An approximation to the velocity distribution is shown in the figure. Your job is to calculate the corresponding volumetric flow rate in m^3/s .

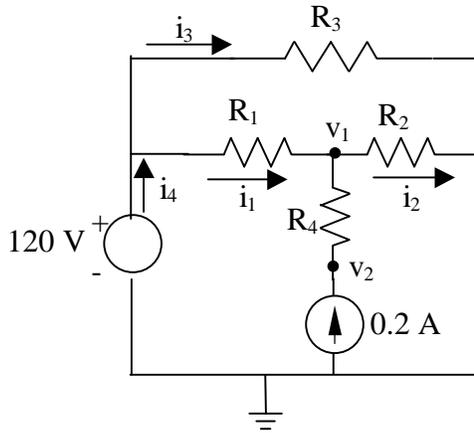

8. What does steady state mean?

Problem

20 pts
 Sept. 22, 1998

Given the circuit below write the equations necessary to solve for all the unknown currents and voltages (measured with respect to ground) in the problem. Assume R_1 , R_2 , R_3 , and R_4 are known. **DO NOT SOLVE THESE EQUATIONS.** Be sure to include some text telling me what you're doing and clearly label the circuit with the unknown quantities.

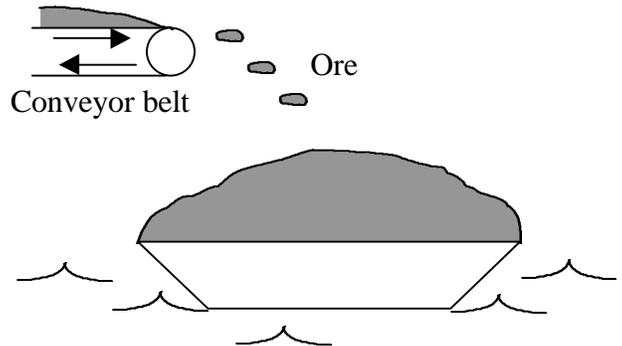

Unknowns	Equation Numbers

Ore is loaded on a barge using the conveyor system shown. The conveyor loads 2 tons of ore per hour onto the barge. Once the pile on the barge has reached 10 tons ore is lost over the side at a rate of 0.05 times the amount of mass in excess of 10 tons, that is, $\dot{m}_{\text{lost}} = 0.05(m_{\text{pile}} - 10)$.

Determine:

- The time, t_1 , required for the ore on the barge to reach a mass of 10 tons.
- An expression for the rate of change of the mass of the pile for $t > t_1$
- The steady state amount of ore in the pile.

NOTE: FOR MORE THAN A 70% GRADE ON THIS PROBLEM you must clearly show how you modeled the system using the given information, the fundamental laws and basic concepts of this course, and any additional assumptions.

A sugar syrup (20% by weight water) is being concentrated in a two stage evaporator. The syrup enters the first evaporator in which 75% of the entering water is removed and leaves as a pure water stream. The product rich syrup stream is further concentrated in the second stage where 60% of the entering water is removed. If 100 kg/hr of the syrup are fed to the first evaporator, determine the equations necessary to calculate the flowrates and compositions of each of the other flows. **DO NOT SOLVE THE EQUATIONS** - Your solution should consist of a list of unknowns and equations.
