

Fracture Summary

Type	Appearance	Microstructure
Ductile	<ul style="list-style-type: none"> • Obvious macroscopic plastic deformation • Shear lips - 45 degrees from principal tensile stress • non-reflective surfaces 	<ul style="list-style-type: none"> • Microvoid formation and coalescence. • Shear deformation failure
Brittle	<ul style="list-style-type: none"> • Chevron “V” pattern-ridges or radiating lines • no plastic deformation, pieces fit back together • reflective fracture surfaces • fracture perpendicular to tensile stress 	<ul style="list-style-type: none"> • flat cleavage planes; intragranular failure OR • intergranular failure; rock candy appearance
Fatigue	<ul style="list-style-type: none"> • “Beach” marks or clamshell marks indicate crack growth • Polished surface faces along with ductile or brittle fracture 	<ul style="list-style-type: none"> • fatigue striations, possibly
