

# OBJECTS AND GRAPHICS

CSSE 120 – Rose-Hulman Institute of Technology

# Outline

---

- Eclipse
- The object of objects
- Graphics
- Creating and using objects
- Interactive graphics
- Coordinate systems
- In-class practice time

# input() and raw\_input() are related through the `eval` function

- Syntax:
  - ▣ `eval(<string>)`
- Semantics
  - ▣ Input: any string
  - ▣ Output: result of evaluating the string as if it were a Python expression
- On yesterday's quiz, you investigated the relationship between `input` and `raw_input`.
- How does `eval` relate them?

# Eclipse configuration

- If you haven't yet shown me your working Eclipse configuration, show me:
  - ▣ The output of either spam.py or greeting.py
  - ▣ spam.py **source code** if you have it
    - **Window > Open perspective > Other > SVN Repository Exploring** otherwise
- While I am checking people's code, please do question 1 on the quiz.

# Integrated Development Environments (IDEs)

- What are they?
- Why use one?
- Our IDE – Eclipse
  - ▣ Why we chose it
  - ▣ Basic concepts in Eclipse
    - Workspace, Workbench
    - Files, folders, projects
    - Views, editors, perspectives
    - <http://www.rose-hulman.edu/class/csse/resources/Eclipse/installation.htm>

The next slides address the listed points

# If your Eclipse still doesn't work

- Go to course Angel page:  
Resources → Course Resources section →  
expand CSSE 120 Course Resources →  
click Course Resources Page →  
click Configuring Python on Eclipse in the  
Software Installation section
- Scroll down to the section:  
**Configuring PyDev**
- Complete the instructions to the end of the document
- Get help as needed

# IDEs – What are they?

An IDE is an application that makes it easier to develop software.

They try to make it easy to:

The image shows a screenshot of the PyDev IDE interface. The main window displays a Python script named `test.py` with the following code:

```
import math

print "I am a newer Python module"
for i in range(10):
    print math.pow(i,2)
```

The interface includes several panels and callouts:

- Pydev Package Explorer:** Shows the project structure with folders like `test` and `src`, and files like `test.py`. Callout: "See the outline of the entire project".
- Main Editor:** The central area where code is written and edited. Callout: "Type and change code (editors)".
- Outline:** A panel on the right showing the structure of the code, including the `math` module. Callout: "See the outline of a chunk of code".
- Console:** A panel at the bottom showing the output of the code execution. Callout: "See output".
- Menu Bar:** Contains menus like File, Edit, Source, Refactoring, Navigate, Search, Project, Run, Window, and Help. Callout: "Compile, run, debug, document".

# IDEs – Why use one?

An IDE is an application that makes it easier to develop software.

They try to make it easy to:

The screenshot shows the Eclipse IDE interface with the following components and annotations:

- Menu Bar:** File, Edit, Source, Refactoring, Navigate, Search, Project, Run, Window, Help. Annotation: "Compile, run, debug, document" (with an arrow pointing to the Run button).
- Pydev Package Explorer:** Shows a project structure with folders like 'test' and 'src', and a file 'test.py'. Annotation: "See the outline of the entire project" (with an arrow pointing to the Package Explorer).
- Editor:** Contains Python code:

```
import math

print "I am a newer Python module"
for i in range(10):
    print math.pow(i,2)
```

Annotation: "Type and change code (editors)" (with an arrow pointing to the code).
- Outline:** Shows a tree view of the code structure, currently displaying 'math'. Annotation: "See the outline of a chunk of code" (with an arrow pointing to the Outline view).
- Problems/Console:** Shows the output of the code execution:

```
<terminated> C:\Documents and Settings\...
16.0
25.0
36.0
49.0
64.0
81.0
```

Annotation: "See out" (with an arrow pointing to the console output).

**Eclipse is:**

- **Powerful** -- everything here and more
- **Easy** to use
- **Free** and **open-source**
- An IDE for **any language**, not just Python
- **What our upper-class students told us to use!**

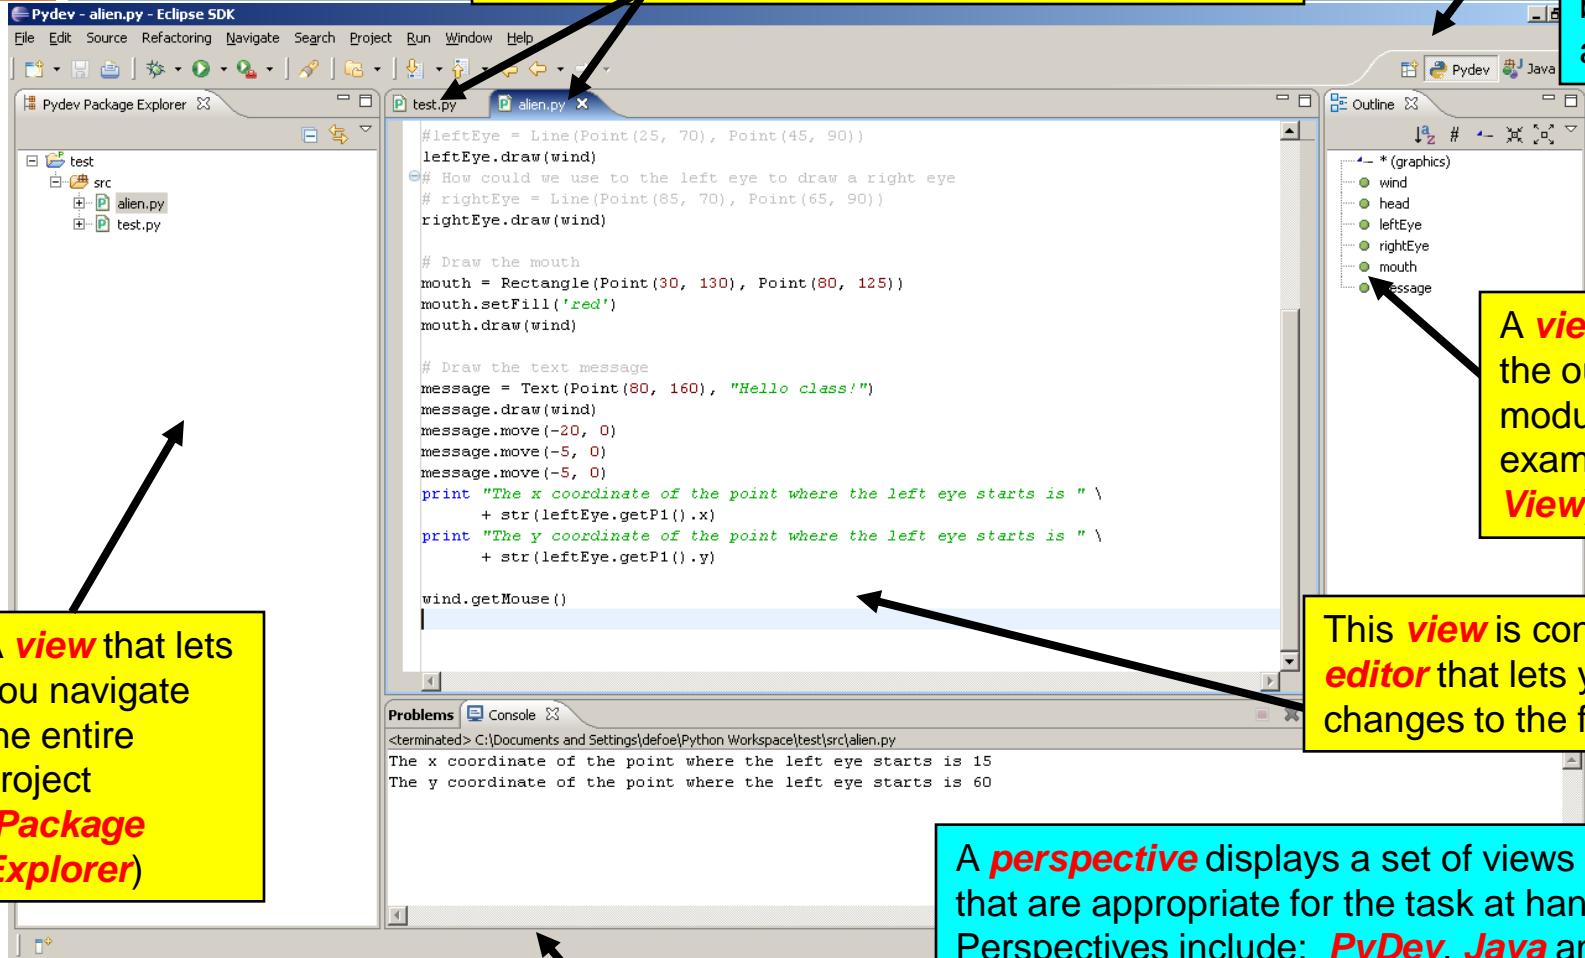

# Basic concepts in Eclipse

- **Workspace** – where your **projects** are stored on your computer
- **Project** – a collection of files, organized in folders, that includes:
  - **Source code** (the code that you write)
  - **Compiled code** (what your source code is translated into, for the machine to run)
  - **Design documents**
  - **Documentation**
  - **Tests**
    - And more that you will learn about over time
- **Workbench** – what we saw on the previous slide, that is, the tool in which you do your software development

# Views, editors, perspectives

Tabbed **views** of the source code of this project

This is the **PyDev perspective** but just a button click brings us to another

A **view** that lets you navigate the entire project (**Package Explorer**)

A **view** that shows the outline of the module being examined (**Outline View**)

This **view** is controlled by an **editor** that lets you make changes to the file

A **perspective** displays a set of views and editors that are appropriate for the task at hand. Perspectives include: **PyDev, Java** and lots more

Tabbed **views** (**Problems, Console**)

# The object of objects

- Data types for strings and numbers are **passive**
  - ▣ Each represents set of values
    - Passive
  - ▣ Each has set of operations
    - Active
- Most modern computer programs built using Object-Oriented (OO) approach
  - ▣ Objects regarded as **active data type**
    - Know stuff
    - Can do stuff

# The object of objects

- Basic Idea of OO development
  - ▣ View complex system as interaction of simple objects
  - ▣ Example: the human body is a complex system

# How do objects interact?

- Objects interact by sending each other **messages**
  - ▣ Message: request for object to perform one of its operations
  - ▣ Example: the brain can ask the feet to walk
  - ▣ In Python, messages happen *via* **method calls**.
- `>>> win = GraphWin()`
- `>>> p = Point(50, 60) # constructor`
- `>>> p.getX() # accessor method`
- `>>> p.getY()`
- `>>> p.draw(win)`

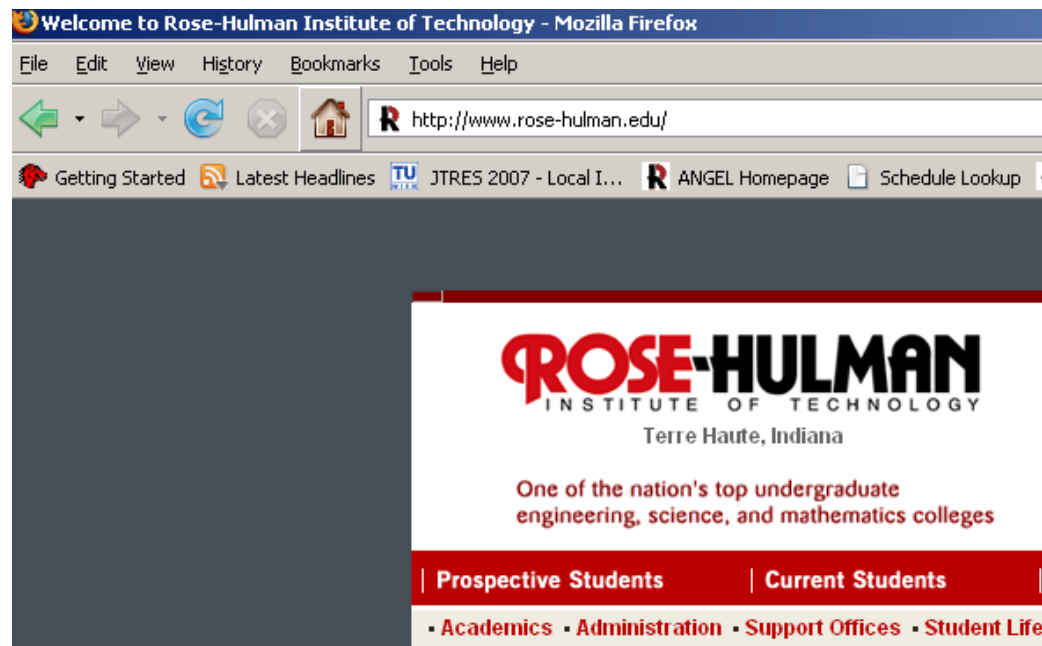

# How do objects interact? Point

```
p = Point(50, 60)
```

# Simple graphics programming

- Graphics is fun and provides a great vehicle for learning about objects
- Computer graphics: study of graphics programming
- Graphical User Interface (GUI)

# You choose how to import

- Must import graphics library before accessing it
  - `>>> import zellegraphics`
  - `>>> win = zellegraphics.GraphWin()`
- Another way to import graphics library
  - `>>> from zellegraphics import *`
  - `win = GraphWin()`

# Using graphical objects

- Using different types of objects from the graphics library, draw the following **alien face** and message

# Paige clearly isn't working on homework for CSSE1 20

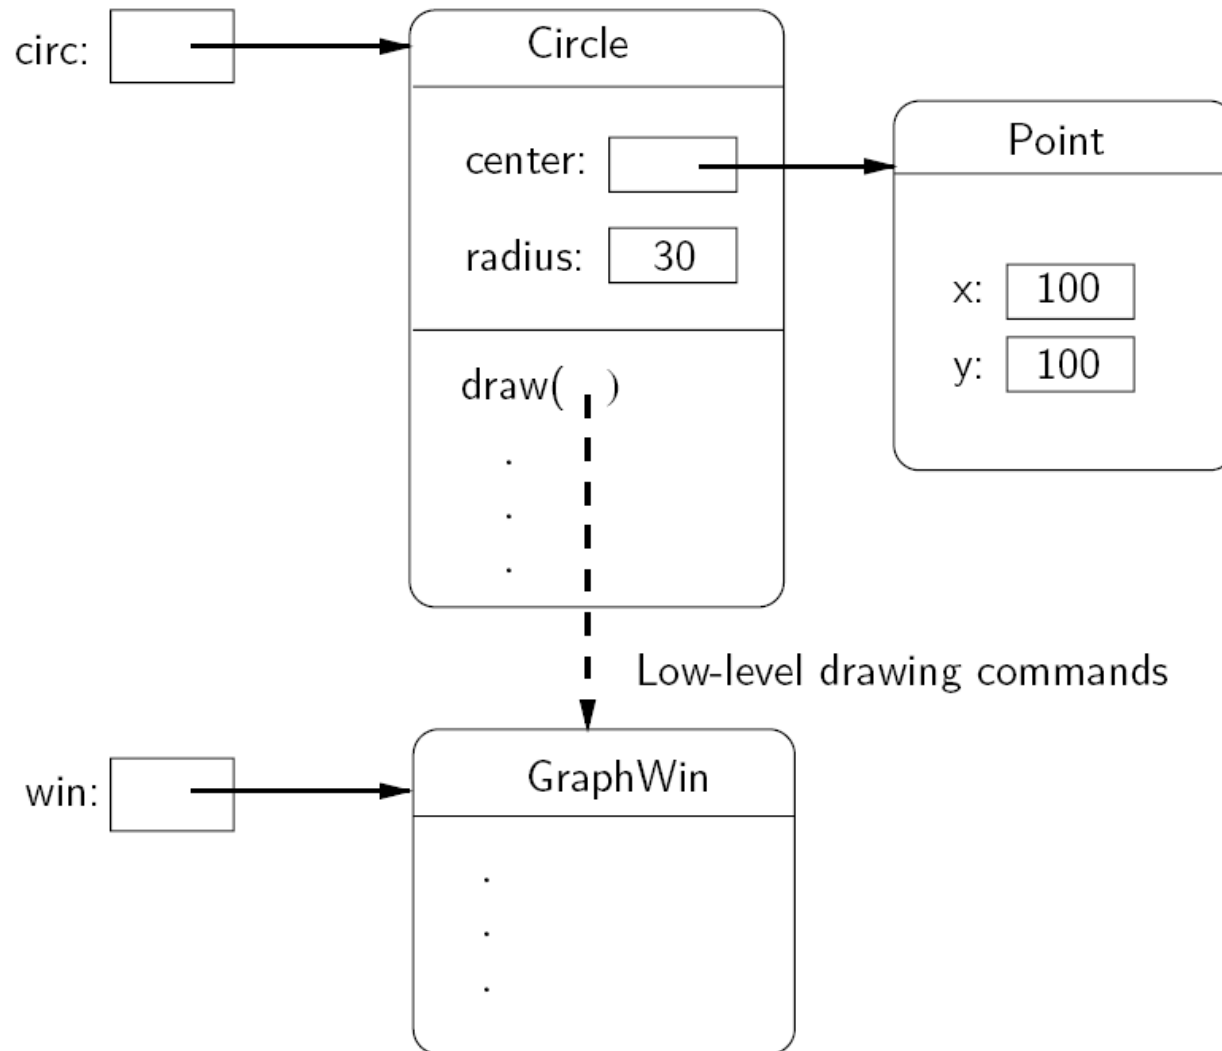

- Preview of tonight's homework:
  1. Read in and draw cool plots from the points in the files you generated in HW5
  2. Create a cool slideshow picture viewer!

# Review: Class and object terminology

- Different types of objects
  - ▣ Point, Line, Rectangle, Oval, Text
  - ▣ These are examples of *classes*
- Different objects
  - ▣ head, leftEye, rightEye, mouth, message
  - ▣ Each is an *instance* of a class
  - ▣ Created using a *constructor*
  - ▣ Objects have *instance variables*
  - ▣ Objects use *methods* to operate on instance variables

# Object interaction to draw a circle

# Interactive graphics

- *GUI*—Graphical User Interface
  - Accepts input
    - Keyboard, mouse clicks, menu, text box
  - Displays output
    - In graphical format
    - On-the-fly
- Developed using *Event-Driven Programming*
  - Program draws interface elements (*widgets*) and waits
  - Program responds when user does something

# getMouse

- `win.getMouse()`
  - ▣ Causes the program to halt, waiting for the user to click with the mouse somewhere in the window
  - ▣ To find out where it was clicked, assign it to a variable:
    - `p = win.getMouse()`

# Mouse Event Exercise

Together, let's solve the following problem:

Create a program, `clickme.py`, with a window labeled "Click Me!" that displays the message *You clicked (x, y)* the first 5 times the user clicks in the window.

The program also draws a red-filled circle, with blue outline, for each of these first 5 clicks.

The program closes the window on the 6<sup>th</sup> click

# Coordinate systems

- An important use of graphics is to represent **data** visually
  - ▣ Example: a bar chart
- We really want  $(0,0)$  to be in the lower-left corner

# Desired coordinate system

- `setCoords(x1, y1, x2, y2)` method from `GraphWin` class
  - ▣ Sets the coordinates to run from  $(x1, y1)$  in the lower-left corner to  $(x2, y2)$  in the upper-right corner.
