Matt Boutell and Curt Clifton

Problem

Learning to program is hard. Students benefit from the help of an expert coach. Finding **time** for this is an issue, because we must also present concepts, show examples, and model problem solving. Pace is also an issue because some of our students arrive with confidence and prior experience, while others become overwhelmed.

Solution?

We created **video modules** for a C programming unit. Students watch the videos to learn new concepts, see concrete examples of them, and observe an expert solving real problems. You can't do that in a book! Students stay engaged while watching the videos by solving on-paper active learning problems and doing follow-along coding exercises.

Every Class a Lab

Our students come to class primed to put what they've learned into practice. We open the floor for questions at the start of class. Students then spend the rest of the class period solving problems either alone or in pairs. Students get expert coaching, receive more individual attention, and set their own pace. Students focus on **confronting their**

misconceptions because we are immediately able to help with tool problems and obscure error messages.

Assessment Plan

We are interested in these questions:

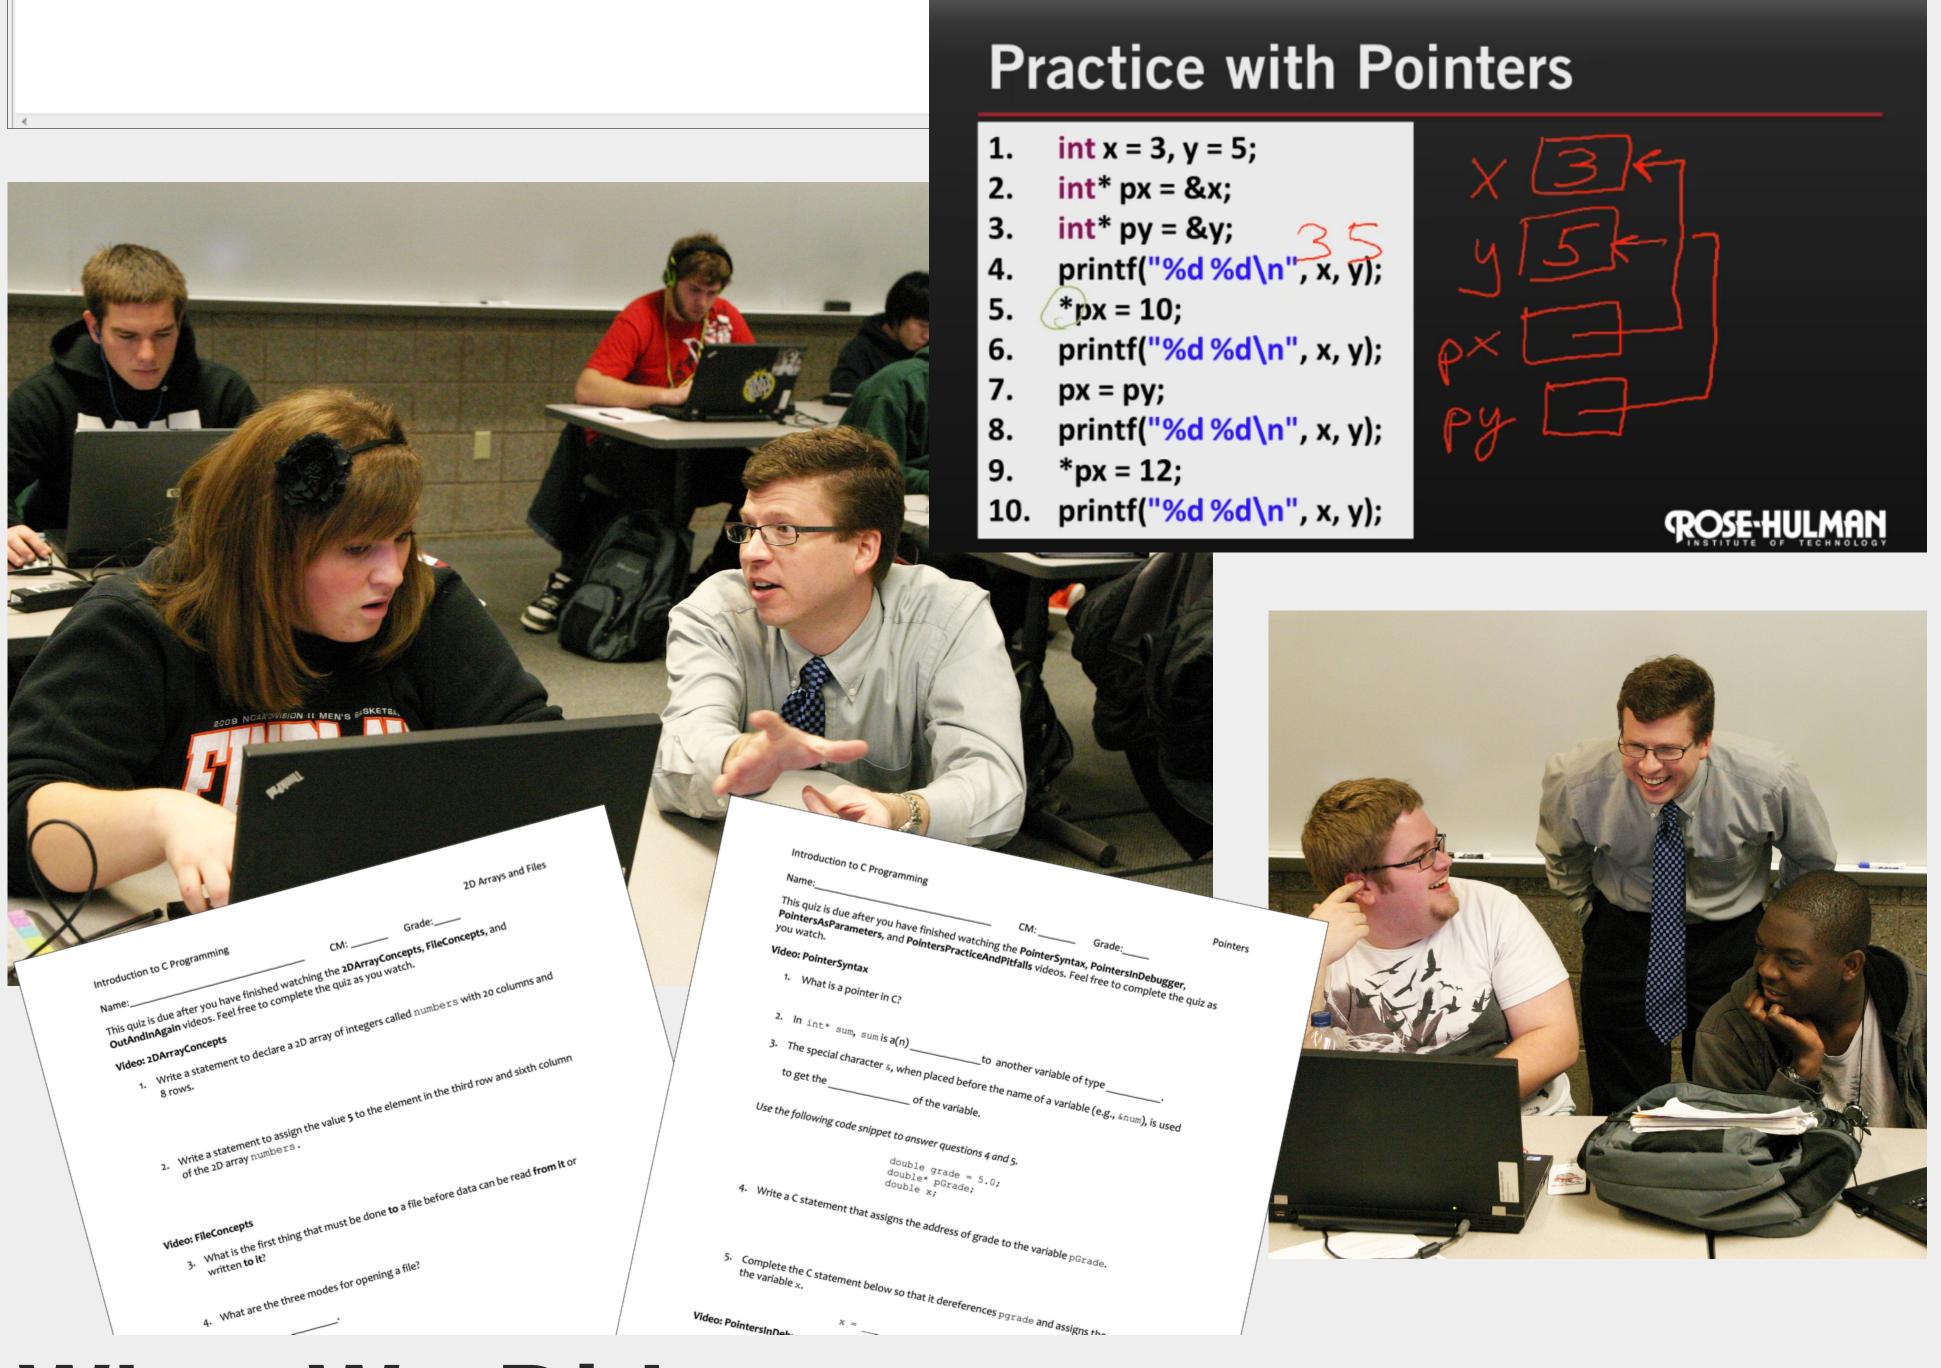

- How does the new format affect perceptions of class time and instructor effectiveness?
- How does the new format affect performance on assignments and exams?
- Do assignment and exam performance correlate with video viewing behavior?
- Do students in the lower half of the class benefit more from extra examples and mentored practice?

We are assessing nine sections of CS1 this year-four taught traditionally and five via videos-using surveys, grade data, and video download logs.

SPLICE: Self-Paced Learning in an Inverted Classroom Environment

What We Did

We began with classroom-tested examples and slides, but simplified the slides to reduce distraction.	We we
	То
We created short video modules to:	•
 Introduce concepts and 	٠
 Model the problem solving process 	٠
To help students wanting more practice,	
we created extra problem solving videos beyond what we assigned.	•
Our recording environment included: Camtasia Studio 	•
 PowerPoint 	Fif
 Eclipse 	ab
 Wacom Cintig interactive pen display 	pla

'e produced **233 minutes of video**, which e are using for the final third of CS1.

- produce each video, we:
- Converted existing in-class quizzes Created presentation slides Recorded separate video segments for
- slides and coding
- Combined and edited video segments, adding music and credits (sometimes
- re-recording short segments)
- Rendered MPEG-4 videos for posting

fteen minutes of finished video took

bout 3 hours of effort from initial anning to final production.

Current Status

Feedback from three video-based sections was mixed. Instructors all found it beneficial. One wrote, "They were a HUGE win for me and fit my style of teaching perfectly...I don't intend to do anything live in the spring in C." Students liked the **convenience**, setting their own **pace**, and the additional work **time** in class. However, they also disliked **not getting immediate** answers to their initial questions.

Future Work

In the coming months, we will continue to collect assessment data and will post the videos to YouTube. Next, we plan to disseminate the results of the first year's study and add closed captioning to the videos. Future directions include inverting a full course, trying a fully self-paced version, and assessing the effectiveness of videos as review material.
