# CSSE 220 Day 3

API Documentation, Unit Tests, and Object References Implementing Classes in Java, using Documented Stubs, Test-First Programming

Check out *JavadocsAndUnitTesting* and *WordGames* from SVN

#### Java Documentation

#### >> API Documentation, Docs in Eclipse, Writing your own Docs

#### Java API Documentation

- What's an API?
  - Application Programming Interface
- The Java API on-line
  - Google for: java api documentation 6

You need the 6 to get the current version of Java

Or go to: <u>http://java.sun.com/javase/6/docs/api/</u>

 Also hopefully on your computer at <u>C:\Program Files\Java\jdk1.6.0\_14\docs\api\index.html</u>

#### Java Documentation in Eclipse

- Setting up Java API documentation in Eclipse
  - Should be done already,
  - If the next steps don't work for you, instructions are in today's homework
- Using the API documentation in Eclipse
  - Hover text
  - Open external documentation (Shift-F2)

#### **Review: Writing Javadocs**

- Written in special comments: /\*\* ... \*/
- Can come before:
  - Class declarations
  - Field declarations
  - Constructor declarations
  - Method declarations
- Eclipse is your friend!
  - It will generate Javadoc comments automatically
  - It will notice when you start typing a Javadoc comment

Add javadoc comments to StringMethodsPractice

Use Quick Fix!
 (click on light bulb)

#### Javadocs: Key Points

- Don't try to memorize the Java libraries
  - Nearly 9000 classes and packages!
  - You'll learn them over time
- Get in the habit of writing the javadocs before implementing the methods
  - It will help you think before doing, a vital software development skill
  - This is called programming with *documented stubs*
  - I'll try to model this. If I don't, call me on it!

## Writing Code to Test Your Code

>> Test-driven Development, unit testing and JUnit

#### **Unit Testing**

- Using code that you write to test other code
  - Focused on testing individual pieces of code (units) in isolation
    - Individual methods
    - Individual classes

Why would software engineers do unit testing?

### **Unit Testing With JUnit**

JUnit is a unit testing *framework* 

- A *framework* is a collection of classes to be used in another program.
- Does much of the work for us!
- JUnit was written by
  - Erich Gamma
  - Kent Beck
- Open-source software
- Now used by **millions** of Java developers

#### JUnit Example

- MoveTester in Big Java shows how to write tests in plain Java
- Look at JUnitMoveTester in today's repository
  - Shows the same test in JUnit
  - Let's look at the comments and code together...

#### **Interesting Tests**

- Test "boundary conditions"
  - Intersection points:  $-40^{\circ}C = = -40^{\circ}F$
  - Zero values: 0°C == 32°F
  - Empty strings
- Test known values: 100°C == 212°F
  - But not too many
- Tests things that might go wrong
  - Unexpected user input: "zero" when 0 is expected
- Vary things that are "important" to the code
  - String length if method depends on it
  - String case if method manipulates that

>>> Unit test *shout*, *whisper*, and *holleWerld* using "interesting" test cases

#### **Object References**

>>> Differences between primitive types and object types in Java

#### What Do Variables Really Store?

- Variables of number type store values
- Variables of class type store references
  - A reference is like a pointer in C, except
    - Java keeps us from screwing up
    - No & and \* to worry about (and the people say, "Amen")

Consider:

1. int x = 10;2. int y = 20;

3. Rectangle box = new Rectangle(x, y, 5, 5);

X

box

10

20

10

20

#### Assignment Copies Values

- Actual value for number types
- Reference value for object types
  - The actual object is not copied
  - The reference value ("the pointer") is copied
- Consider:
   int x = 10;
- 2. int y = x;
- 3. y = 20;

4. Rectangle box = new Rectangle(5, 6, 7, 8);
5. Rectangle box2 = box;
6. box2.translate(4, 4);

box

box2

8

#### Encapsulation

Separating implementation details from how an object is used

#### Encapsulation in Object-Oriented Software

- Encapsulation—separating implementation details from how an object is used
  - Client code sees a *black box* with a known *interface*
  - Implementation can change without changing client

	Functions	Objects
Black box exposes	Function signature	Constructor and method signatures
Encapsulated inside the box	Operation implementation	<u>Data</u> <u>storage</u> and <u>operation</u> implementation

#### How To: Do Small Talk

But surely I owe you an accurate answer!

#### How to: implement an interface

- An interface is a real construct in OOP languages
  - It's just a list of method signatures (no implementations)
- If a class implements an interface, it must implement all those methods
- We'll use them in today's assignment

#### How To: Implement a Class

- 1. Create the (initially empty) class
  - File  $\Rightarrow$  New  $\Rightarrow$  Class
- 2. Write *documented stubs* for the public interface of the class
- 3. Implement the class:
  - Determine and implement instance fields
  - Implement constructors and methods, adding private methods and additional instance fields as needed
- 4. Test the class

# 3. Test and implement each constructor and method

• Write the test cases BEFORE implementing the constructor/method

# Live Coding

#### Censor

- Censor: given a string *inputString*, produces a new string by replacing each occurrence of charToCensor with a "\*" (an asterisk).
- How do you deal with charToCensor ?
  - Can it be a parameter of *transform*?
    - No, that violates the StringTransformable interface
  - Can it be a local variable of *transform*?
    - No, it needs to live for the entire lifetime of the Censor.
  - What's left?
    - Answer: It is a *field* ! (What is a sensible name for the field?)
- How do you initialize the field for **charToCensor**?
  - Answer: by using Censor's constructors!

# Live Coding

## Wrap up Quiz

# >>> Continue with homework if time permits

We will make additional slides with sample code available to you after class
