

# CSSE 220

Arrays, ArrayLists,  
Wrapper Classes, Auto-boxing,  
Enhanced *for* loop

Check out *ArrayListPractice* from SVN

# Syllabus Highlights

- You should read the whole thing
- But pay special attention to the grading policies of the course

# Review of types

- Primitives
  - int, double, char, boolean, long, ...
- Objects
  - String, ...
- Gotchas:

What is  $7/2$ ?

*Alternatives?*

What is  $x/y$  if  $x$  and  $y$  are both ints?

*Alternatives?*

What is  $s$  after these 2 lines?

```
String s = "computer";  
s.substring(0,3);
```

*Alternatives?*

# Arrays- What, When, Why, & How?

- What
  - A special **type** used to hold a set number of items of a specified type
- When
  - Use when you need to store multiple items of the same type
  - Number of items is known and **will not change**

# Arrays- What, When, Why, & How?

- Why
  - Avoids things like int1, int2, int3, int4
  - Avoids repetitive code and frequent updates
- How
  - `Type[] arr = new Type[num];` ← Creates a new array of type Type stored in variable arr
  - An array of 5 Strings (stored in the variable fiveStrings) would look like this:
    - `String[] fiveStrings = new String[5];`

# Array Examples Handout

- Form groups of 2
- Look at the Array Examples Handout
- Study how arrays are used and answer the questions in the quiz
  - FIRST PAGE OF QUIZ ONLY

Go to <http://codingbat.com/java/Array-2>

- Work in your groups to solve fizArray3, bigDiff, shiftLeft
- If you finish early, try zeroFront

# Array Types

- ▶ Group a collection of objects under a single name
- ▶ Elements are referred to by their **position**, or *index*, in the collection (0, 1, 2, ...)
- ▶ Syntax for declaring: *ElementType[] name*
- ▶ Declaration examples:
  - A local variable: `double[] averages;`
  - Parameters: `public int max(int[] values) {...}`
  - A field: `private Investment[] mutualFunds;`

# Allocating Arrays

- ▶ Syntax for allocating:

`new ElementType[Length]`

- ▶ Creates space to hold values

- ▶ Sets values to defaults

- `0` for number types
- `false` for boolean type
- `null` for object types

- ▶ Examples:

- `double[] polls = new double[50];`
- `int[] elecVotes = new int[50];`
- `Dog[] dogs = new Dog[50];`

Don't forget this step!

This does NOT construct any **Dogs**. It just allocates space for referring to **Dogs** (all the **Dogs** start out as *null* )

# Reading and Writing Array Elements

## ▶ Reading:

- `double exp = polls[42] * elecVotes[42];`

Sets the value in  
slot 37.

Reads the element with  
index 42.

## ▶ Writing:

- `elecVotes[37] = 11;`

▶ Index numbers run from 0 to array length – 1

▶ Getting array length: `elecVotes.length`

No parentheses, array length  
is (like) a field

# Arrays: Comparison Shopping

| Arrays...  | Java       | Python lists |
|--|------------|--------------|
| <i>have fixed length</i>   | <i>yes</i> | <i>no</i>    |
| <i>are initialized to default values</i>   | <i>yes</i> | <i>n/a</i>   |
| <i>track their own length</i>  | <i>yes</i> | <i>yes</i>   |
| <i>trying to access "out of bounds" stops program before worse things happen</i> | <i>yes</i> | <i>yes</i>   |

# ArrayList- What, When, Why, & How?

- What
  - A class in a Java library used to hold a collection of items of a specified type
  - Allows variable number of items
  - Fast random access
- When
  - Use when you need to store multiple items of the same type
  - Number of items is not known/will change

# ArrayList- What, When, Why, & How?

- Why
  - Fast random access
  - Allows length changes, cannot do this with an array
- How
  - `ArrayList<Type> arl = new ArrayList<Type>();`
    - Creates a new ArrayList of type Type stored in variable arl

# ArrayList Examples Handout

- Look at the `ArrayList` section of the examples handout
- Study how `arrayLists` are used and answer the questions in the quiz
- Then solve the 3 problems in `ArrayListPractice` (you downloaded it from SVN)

# What if we don't know how many elements there will be?

## ▶ **ArrayLists** to the rescue

### ▶ Example:

Element type

Optional in Java 7 and onwards

e.g., `new ArrayList<>()`

◦ `ArrayList<State> states = new ArrayList<State>();`

Variable type

Constructs new, empty list

◦ `states.add(new State("Indiana", 11, .484, .497));`

Adds new element to end of list

`states.add(new State("Indiana", 11, .484, .497));`

## ▶ **ArrayList** is a *generic class*

◦ Type in <brackets> is called a *type parameter*

# ArrayList Gotchas

- Type parameter can't be a primitive type
  - Not: `ArrayList<int> runs;`
  - But: `ArrayList<Integer> runs;`
- Use *get* method to read elements
  - Not: `runs[12]`
  - But: `runs.get(12)`
- Use `size()` not `length`
  - Not: `runs.length`
  - But: `runs.size()`

# Lots of Ways to Add to List

▶ Add to end:

- `victories.add(new WorldSeries(2011));`

▶ Overwrite existing element:

- `victories.set(0, new WorldSeries(1907));`

▶ Insert in the middle:

- `victories.add(1, new WorldSeries(1908));`
- Pushes elements at indexes 1 and higher up one

▶ Can also remove:

- `victories.remove(victories.size() - 1)`

# So, what's the deal with primitive types?

## ▶ Problem:

- ArrayList's only hold objects
- Primitive types aren't objects

## ▶ Solution:

- *Wrapper classes*—instances are used to “turn” primitive types into objects
- Primitive value is stored in a field inside the object

| Primitive      | Wrapper          |
|----------------|------------------|
| <i>byte</i>    | <i>Byte</i>      |
| <i>boolean</i> | <i>Boolean</i>   |
| <i>char</i>    | <i>Character</i> |
| <i>double</i>  | <i>Double</i>    |
| <i>float</i>   | <i>Float</i>     |
| <i>int</i>     | <i>Integer</i>   |
| <i>long</i>    | <i>Long</i>      |
| <i>short</i>   | <i>Short</i>     |

# Work Time

- Finish all the in-class material exercises if you haven't yet
- Work on TwelveProblems
