Summary 13 – Try/catch

TODO: This summary needs to be reworked, but it shows the basic idea OK for now.

- What is this?

Instead of embedding multiple if statements in our code to check for errors, Java provides the try/catch notation:

```
try {

        Blah…

        Blah…

        Blah..

} catch (exceptionType exception) {

        Foo…

        Foo…

}
```

This tries the statements in the try clause, dropping into the catch clause if an exception (error) occurs.
