# CSSE 230 Day 2 

Growable Arrays Continued Big-Oh and its cousins

## Answer Q1 from today's in-class quiz.

## Agenda and goals

- Finish course intro
- Growable Array recap
- Big-Oh and cousins
- After today, you'll be able to
- Use the term amortized appropriately in analysis
- explain the meaning of big-Oh, big-Omega ( $\Omega$ ), and big-Theta ( $\theta$ )
- apply the definition of big-Oh to prove runtimes of functions
- use limits to show that a function is $\mathrm{O}, \theta$, or $\Omega$ of another function.

## Announcements and FAQ

- You will not usually need the textbook in class
- Late days?
- Test policy: Individual competence requirement

You must demonstrate programming competence on exams to succeed

- See syllabus for exam weighting and caveats.
- Think of every program you write as a practice test
- Especially HW4 and test 2a

## Warm Up and Stretching thoughts

- Short but intense! $\sim 45$ lines of code total in our solutions to all but Adder
- Be sure to read the description of how it will be graded. Note how style will be graded.
- Demo: Running the JUnit tests for test, file, package, and project

Demo: Run the Adder program

## Questions?

- About Homework 1?
- Aim to complete tonight, since it is due after next class
- It is substantial (in amount of work, and in course credit)
- About the Syllabus?
Q2-3

## Growable Arrays Exercise <br> Daring to double

## Growable Arrays Table

| $\mathbf{N}$ | $\mathbf{E}_{\mathbf{N}}$ | Answers for problem 2 |
| :---: | :---: | :---: |
| 4 | 0 | 0 |
| 5 | 0 | 0 |
| 6 | 5 | 5 |
| 7 | 5 | $5+6=11$ |
| 10 | 5 | $5+6+7+8+9=35$ |
| 11 | $5+10=15$ | $5+6+7+8+9+10=45$ |
| 20 | 15 | $\operatorname{sum}(\mathrm{i}, \mathrm{i}=5 . .20)=200$ |
| 21 | $5+10+20=35$ | $\operatorname{sum}(\mathrm{i}, \mathrm{i}=5 . .39)=770$ |
| 40 | 35 | $\operatorname{sum}(\mathrm{i}, \mathrm{i}=5 . .40)=810$ |
| 41 | $5+10+20+40=75$ |  |

## Doubling the Size

- Doubling each time:
- Assume that $\mathrm{N}=5\left(2^{\mathrm{k}}\right)+1$.
- Total \# of array elements copied:

| $k$ | N | \#copies |
| :--- | :--- | :--- |
| 0 | 6 | 5 |
| 1 | 11 | $5+10=15$ |
| 2 | 21 | $5+10+20=35$ |
| 3 | 41 | $5+10+20+40=75$ |
| 4 | 81 | $5+10+20+40+80=155$ |
| $k$ | $=5\left(2^{\mathrm{k}}\right)+1$ | $5\left(1+2+4+8+\ldots+2^{\mathrm{k}}\right)$ |

[^0]
## Adding One Each Time

- Total \# of array elements copied:

## Conclusions

- What's the average overhead cost of adding an additional string...
- in the doubling case?
- in the add-one case?

## This is called the amortized cost

- So which should we use?

# More math review 

## Review these as needed

- Logarithms and Exponents
- properties of logarithms:

$$
\begin{aligned}
& \log _{b}(x y)=\log _{b} x+\log _{b} y \\
& \log _{b}(x / y)=\log _{b} x-\log _{b} y \\
& \log _{b} x^{\alpha}=\alpha \log _{b} x \\
& \log _{b} x=\frac{\log _{a} x}{\log _{a} b}
\end{aligned}
$$

- properties of exponentials:

$$
\begin{aligned}
& \mathrm{a}^{(\mathrm{b}+\mathrm{c})}=\mathrm{a}^{\mathrm{b}} \mathrm{a}^{\mathrm{c}} \\
& \mathrm{a}^{\mathrm{bc}}=\left(\mathrm{a}^{\mathrm{b}}\right)^{\mathrm{c}} \\
& \mathrm{a}^{\mathrm{b} / \mathrm{a}^{\mathrm{c}}=\mathrm{a}^{(\mathrm{b}-\mathrm{c})}} \\
& \mathrm{b}=\mathrm{a}^{\log _{\mathrm{a}} \mathrm{~b}} \\
& \mathrm{~b}^{\mathrm{c}=\mathrm{a}^{\mathrm{c}^{*} \log _{\mathrm{a}} \mathrm{~b}}}
\end{aligned}
$$

## Practice with exponentials and logs

(Do these with a friend after class, not to turn in)
Simplify: Note that $\log n$ (without a specified) base means $\log _{2} n$. Also, $\log \mathrm{n}$ is an abbreviation for $\log (\mathrm{n})$.

## 1. $\log (2 n \log n)$

2. $\log (n / 2)$
3. $\log (\mathbf{s q r t}(n))$
4. $\log (\log (\operatorname{sqrt}(n)))$
5. $\log _{4} n$
6. $2^{2 \log n}$
7. if $n=2^{3 k}-1$, solve for $k$.

Where do logs come from in algorithm analysis?

## Running Times

- Algorithms may have different time complexity on different data sets
- What do we mean by "Worst Case"?
- What do we mean by "Average Case"?
- What are some application domains where knowing the Worst Case time complexity would be important?
- http://cacm.acm.org/magazines/2013/2/160173-the-tail-at-scale/fulltext

## Average Case and Worst Case

## Worst-case vs amortized cost for adding an element to an array using the doubling scheme

Worst-case:
$\mathrm{O}(\mathrm{n})$

amortized:
O(1)

## Asymptotics: The "Big" Three

Big-Oh Big-Omega
Big-Theta

## Asymptotic Analysis

- We only care what happens when N gets large
- Is the function linear? quadratic? exponential?

## Figure 5.1

## Figure 5.3

Functions in order of increasing growth rate

| Function |  | The answer to most big- <br> Oh questions is one of |
| :--- | :--- | :--- |
| $c$ | Constant | these functions |
| $\log N$ | Logarithmic |  |
| $\log ^{2} N$ | Log-squared |  |
| $N$ | Linear |  |
| $N \log N$ | Q $\log N$ | a.k.a "log linear" |
| $N^{2}$ | Cubic |  |
| $N^{3}$ | Exponential |  |
| $2^{N}$ |  |  |

## Simple Rule for Big-Oh

- Drop lower order terms and constant factors
- $7 \mathrm{n}-3$ is $\mathrm{O}(\mathrm{n})$
- $8 n^{2} \log n+5 n^{2}+n$ is $O\left(n^{2} \log n\right)$

## - The "Big-Oh" Notation

- given functions $\mathrm{f}(n)$ and $\mathrm{g}(n)$, we say that $\mathrm{f}(n)$ is $\boldsymbol{O}(\mathrm{g}(n))$ if and only if $\mathrm{f}(n) \leq \mathrm{cg}(n)$ for $n \geq n_{0}$
- c and $n_{0}$ are constants, $\mathrm{f}(n)$ and $\mathrm{g}(n)$ are functions over non-negative integers
$C>0, n_{0} \geq 0$ and an integer

## Big Oh examples

- A function $f(n)$ is (in) $O(g(n))$ if there exist two positive constants $c$ and $n_{0}$ such that for all $n \geq n_{0}$, $\mathrm{f}(\mathrm{n}) \leq \mathrm{c} \mathrm{g}(\mathrm{n})$
- So all we must do to prove that $\mathrm{f}(\mathrm{n})$ is $\mathrm{O}(\mathrm{g}(\mathrm{n}))$ is produce two such constants.
- $\mathrm{f}(\mathrm{n})=4 \mathrm{n}+15, \mathrm{~g}(\mathrm{n})=$ ???.
- $\mathrm{f}(\mathrm{n})=\mathrm{n}+\sin (\mathrm{n}), \mathrm{g}(\mathrm{n})=? ? ?$

> Assume that all functions have non-negative values, and that we only care about $\mathrm{n} \geq 0$. For any function $\mathrm{g}(\mathrm{n}), \mathrm{O}(\mathrm{g}(\mathrm{n})$ ) is a set of functions.

## Big-Oh, Big-Omega and Big-Theta O( ) $\quad \Omega($ ) $\theta$ ( )

- $f(n)$ is $O(g(n))$ if $f(n) \leq c g(n)$ for all $n \geq n_{0}$
- So big-Oh (O) gives an upper bound
- $f(n)$ is $\Omega(g(n))$ if $f(n) \geq c g(n)$ for all $n \geq n_{0}$ - So big-omega ( $\Omega$ ) gives a lower bound
- $f(n)$ is $\theta(g(n))$ if it is both $O(g(n)$ and $\Omega(g(n))$ Or equivalently:
- $f(n)$ is $\theta(g(n))$ if $c_{1} g(n) \leq f(n) \leq c_{2} g(n)$ for all $n \geq n_{0}$ - So big-theta ( $\theta$ ) gives a tight bound

We usually show algorithms (in code) are $\theta(\mathrm{g}(\mathrm{n})$ ). Next class, we'll also discuss how to show problems are $\theta(\mathrm{g}(\mathrm{n})$ ).

- True or false: $3 n+2$ is $\mathrm{O}\left(n^{3}\right)$
- True or false: $3 n+2$ is $\Theta\left(n^{3}\right)$

## Big-Oh Style

- Give tightest bound you can
- Saying $3 n+2$ is $\mathrm{O}\left(n^{3}\right)$ is true, but not as useful as saying it's $\mathrm{O}(n)$
- On a test, we'll ask for $\Theta$ to be clear.
- Simplify:
- You could also say: $3 n+2$ is $O(5 n-3 \log (n)+17)$
- And it would be technically correct...
- It would also be poor taste ... and your grade will reflect that.

## On homework 2...

- Suppose $T_{1}(N)$ is $O(f(N))$ and $T_{2}(N)$ is $O(f(N))$. Prove that $T_{1}(N)+T_{2}(N)$ is $O(f(N))$
- Hint: Constants c1 and c2 must exist for $\mathrm{T}_{1}(\mathrm{~N})$ and $\mathrm{T}_{2}(\mathrm{~N})$ to be $\mathrm{O}(\mathrm{f}(\mathrm{N}))$
- How can you use them?

Try it before next class

## Limitations of big-Oh

- There are times when one might choose a higher-order algorithm over a lower-order one.
- Brainstorm some ideas to share with the class
C.A.R. Hoare, inventor of quicksort, wrote:

Premature optimization is the root of all evil.

## Limits and Asymptotics

- Consider the limit

$$
\lim _{n \rightarrow \infty} \frac{f(n)}{g(n)}
$$

- What does it say about asymptotic relationship between $f$ and $g$ if this limit is...
- 0?
- finite and non-zero?
- infinite?

## Apply this limit property to the following pairs of functions

1. $n$ and $n^{2}$
on these questions and solutions ONLY, let $\log n$ mean natural log
2. $\log n$ and $n$
3. $n \log n$ and $n^{2}$
4. $\log _{a} n$ and $\log _{b} n \quad(a<b)$
5. $n^{a}$ and $a^{n}(a>1)$
6. $a^{n}$ and $b^{n}(a<b)$

Recall l'Hôpital's rule: under appropriate conditions,

$$
\lim _{n \rightarrow \infty} \frac{f(n)}{g(n)}=\lim _{n \rightarrow \infty} \frac{f^{\prime}(n)}{g^{\prime}(n)}
$$

Q13-15

[^0]:    Express as a closed-form expression in terms of K , then express in terms of N
