

# CSSE 230

## Extended Binary Trees Recurrence relations

After today, you should be able to...

- ...explain what an extended binary tree is
- ...solve simple recurrences using patterns

# Reminders / Announcements

## ▶ Today:

- Extended Binary Trees (on HW9)
- Recurrence relations, part 1

## ▶ Due later:

- Hardy's Taxi, part two: efficiency boost!
  - Some HW1 solutions took 60+ sec to find the 4<sup>th</sup> taxicab #.  
Now you'll try to find the 50,000<sup>th</sup> one in the same time!  
... $\theta(n^4)$  won't work.
- **Find and sit with your Hardy partner now**

# Extended Binary Trees (EBT's)

Bringing new life to Null  
nodes!

# An Extended Binary Tree (EBT) just has *null* external nodes as leaves

- ▶ Not a single NULL\_NODE, but many NULL\_NODES
- ▶ An Extended Binary tree is either
  - an *external (null) node*, or
  - an (**internal**) root node and two EBTs  $T_L$  and  $T_R$ .
- ▶ We draw internal nodes as circles and external nodes as squares.
  - Generic picture and detailed picture.
- ▶ This is simply an alternative way of viewing binary trees, in which we view the external nodes as “places” where a search can end or an element can be inserted.

# A property of EBTs

- ▶ **Property**  $P(N)$ : For any  $N \geq 0$ , any EBT with  $N$  internal nodes has \_\_\_\_\_ external nodes.
- ▶ **Prove by strong induction**, based on the recursive definition.
  - A notation for this problem:  $IN(T)$ ,  $EN(T)$

Hint (reminder): Find a way to relate the properties for larger trees to the property for smaller trees.

# Introduction to Recurrence Relations

A technique for analyzing  
recursive algorithms

# Recap: Maximum Contiguous Subsequence Sum problem

*Problem definition:* Given a non-empty sequence of  $n$  (possibly negative) integers  $A_1, A_2, \dots, A_n$ , find the maximum consecutive subsequence  $S_{i,j} = \sum_{k=i}^j A_k$ , and the corresponding values of  $i$  and  $j$ .

# Divide and Conquer Approach

- ▶ Split the sequence in half
- ▶ Where can the maximum subsequence appear?
- ▶ Three possibilities :
  - entirely in the first half,
  - entirely in the second half, or
  - **begins** in the first half and **ends** in the second half

# This leads to a recursive algorithm

1. Using recursion, find the maximum sum of **first** half of sequence
2. Using recursion, find the maximum sum of **second** half of sequence
3. Compute the max of all sums that begin in the first half and end in the second half
  - (Use a couple of loops for this)
4. Choose the largest of these three numbers

```
private static int maxSumRec( int [ ] a, int left, int right )
{
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;

    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;

    int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );

    for( int i = center; i >= left; i-- )
    {
        leftBorderSum += a[ i ];
        if( leftBorderSum > maxLeftBorderSum )
            maxLeftBorderSum = leftBorderSum;
    }

    for( int i = center + 1; i <= right; i++ )
    {
        rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
            maxRightBorderSum = rightBorderSum;
    }

    return max3( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
}
```

N = array size

What's the  
run-time?

```
private static int maxSumRec( int [ ] a, int left, int right )
{
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;

    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;

    int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );

    for( int i = center; i >= left; i-- )
    {
        leftBorderSum += a[ i ];
        if( leftBorderSum > maxLeftBorderSum )
            maxLeftBorderSum = leftBorderSum;
    }

    for( int i = center + 1; i <= right; i++ )
    {
        rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
            maxRightBorderSum = rightBorderSum;
    }

    return max3( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
}
```

Runtime =  
Recursive part +  
non-recursive part

# Analysis?

- ▶ Write a **Recurrence Relation**
  - $T(N)$  gives the run-time as a function of  $N$
  - Two (or more) part definition:
    - Base case,  
like  $T(1) = c$
    - Recursive case,  
like  $T(N) = T(N/2) + 1$

So, what's the recurrence relation for the recursive MCSS algorithm?

```
private static int maxSumRec( int [ ] a, int left, int right )
{
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;

    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;

    int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );

    for( int i = center; i >= left; i-- )
    {
        leftBorderSum += a[ i ];
        if( leftBorderSum > maxLeftBorderSum )
            maxLeftBorderSum = leftBorderSum;
    }

    for( int i = center + 1; i <= right; i++ )
    {
        rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
            maxRightBorderSum = rightBorderSum;
    }

    return max3( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
}
```

Runtime =  
Recursive part +  
non-recursive part

```

private static int maxSumRec( int [ ] a, int left, int right )
{
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;

    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;

    int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );

    for( int i = center; i >= left; i-- )
    {
        leftBorderSum += a[ i ];
        if( leftBorderSum > maxLeftBorderSum )
            maxLeftBorderSum = leftBorderSum;
    }

    for( int i = center + 1; i <= right; i++ )
    {
        rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
            maxRightBorderSum = rightBorderSum;
    }

    return max3( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
}

```

Runtime =  
Recursive part +  
non-recursive part

$$T(N) = 2T(N/2) + \theta(N)$$

$$T(1) = 1$$

# Solve Simple Recurrence Relations

- ▶ One strategy: look for patterns

- ▶ Examples:

**As class:**

- $T(0) = 0, T(N) = 2 + T(N-1)$
- $T(0) = 1, T(N) = 2 T(N-1)$
- $T(0) = T(1) = 1, T(N) = T(N-2) + T(N-1)$

**On quiz:**

- $T(0) = 1, T(N) = N T(N-1)$
- $T(0) = 0, T(N) = T(N-1) + N$
- $T(1) = 1, T(N) = 2 T(N/2) + N$   
(just consider the cases where  $N=2^k$ )

# Next time: More solution strategies for recurrence relations

- ▶ Find patterns
- ▶ Telescoping
- ▶ The master theorem
