

CSSE 230

Red-black trees

After today, you should be able to... ...determine if a tree is a valid red/black tree ...perform top-down insertion in a red/black tree

EditorTrees Milestone 1 due tonight

- If submitted last night, all will earn a late day.
 - (Any teams done early?)
- If submitted late, everyone is charged a late day.
 - Does everyone on my team have a late day?
 - See link from Moodle
 - Some teams have a person with 0 days left

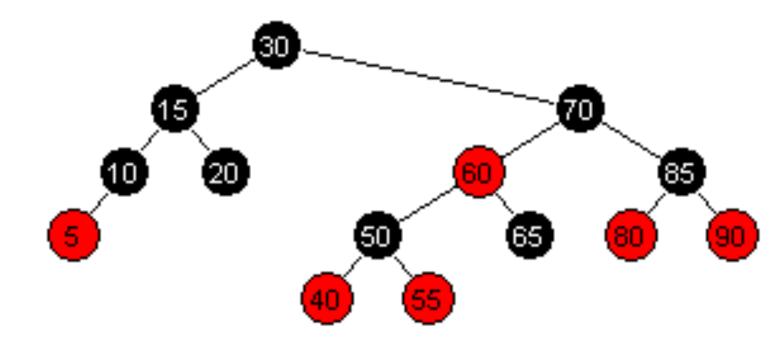

Feedback to help as you move on...

- Milestone 1 is graded on unit tests only.
- But...be sure to fix efficiency issues for the future
 - See final notes in specification
 - Cannot recalculate size or height to update balance codes or handle rotations.
 - You can recalculate **rank and balance codes**: these are O(1) computations per node.
 - Suggestion: update rank (++) on the way down the tree.
 - Update balance codes and do rotations (which change rank and balance codes) on the way back up.
 - So each is O(log n) total
 - Know when you can stop! (day 14 slides have the algorithm for insertion, you'll have to think about deletion)

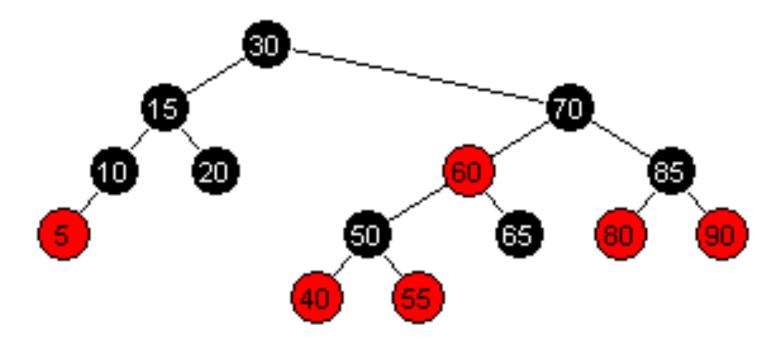

Red-Black Trees

Another type of self-balancing search tree with O(log N) performance A red-black tree is a binary tree with 5 properties:

- 1. It is a BST
- 2. Every node is either colored red or black.
- 3. The root is black.
- 4. No two successive nodes are red.
- 5. Every path from the root to a null node has the same number of black nodes ("perfect black balance")

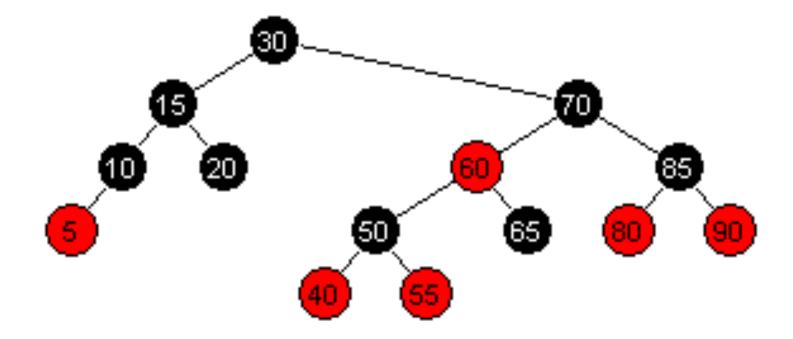

To search a red-black tree, just ignore the colors

Runtime is O(height) Since it's a BST, runtime of insert and delete should also be O(height)

How tall is a red-black tree?

Best-case: if all nodes black, it is ~log n.

Worst case: every other node on the longest path is red. Height ~2 log n.

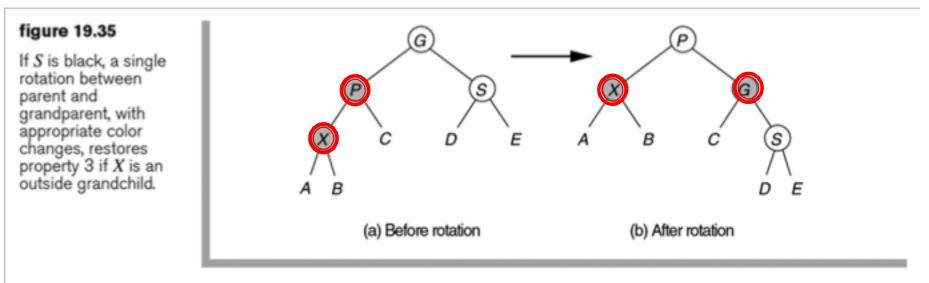

Note: Not height-balanced:

Sometimes taller but often shorter on average.

Bottom-Up Insertion Strategy

- Like BST:
 - Insert at leaf
 - Color it red (to keep perfect black balance)
- But could make two reds in a row?
 - On the recursive travel back up the tree (like AVL),
 - rotate (single- and double-, like AVL)
 - and **recolor** (new)
 - Show now that various "rotation+recoloring"s fix two reds in a row while maintaining black balance.
- At end of insert, always make root of the entire tree black (to fix property 3).

2 Reds in a row, with red outer grandchild and 2 black sibling

Copyright © 2010 Pearson Education

2 Reds in a row, with red inner grandchild and black sibling

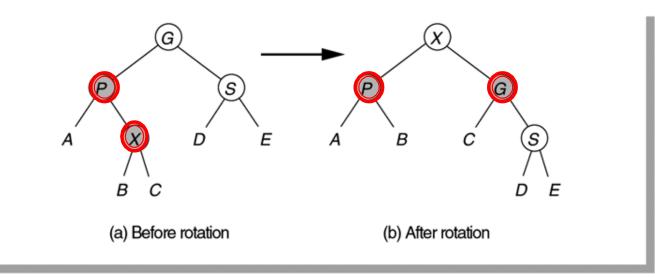

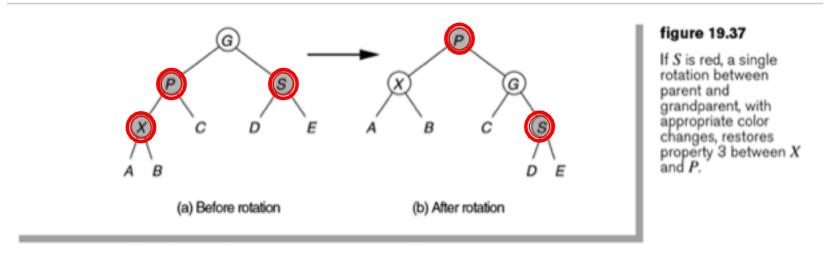

figure 19.36

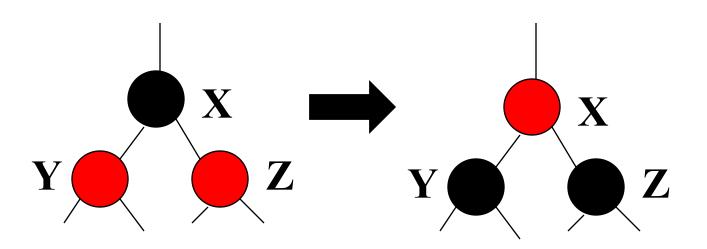

If S is black, a double rotation involving X, the parent, and the grandparent, with appropriate color changes, restores property 3 if X is an inside grandchild.

2 Reds in a row, with red outer grandchild and red sibling

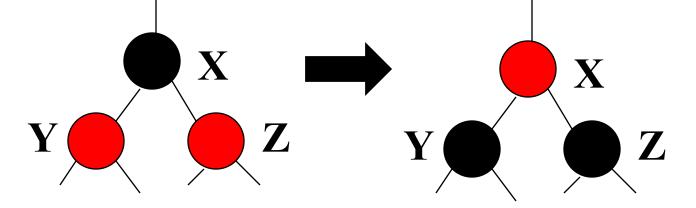

Case 3 (red sibling) can force us to do multiple rotations recursively

- Bottom-Up insertion strategy must be recursive.
- An alternative:
 - If we ever had a black node with two red children, swap the colors and black balance stays.
 - Details next...

Top-down insertion strategy: Recolor red siblings on the way down the tree

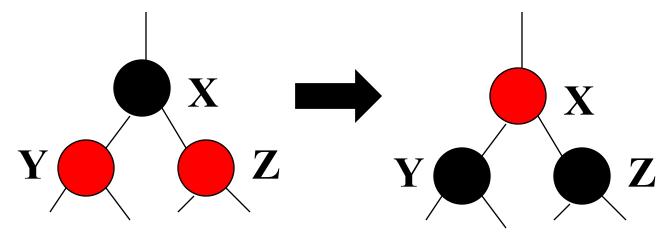

Situation: A black node with two red children.

Action: - Recolor the node red and the children black (if root, make black). - If the parent is red, perform rotations, otherwise continue down the tree

Does this change black balance? No.

Top-Down Insertion Strategy

- On the way down the tree to the insertion point, if ever see a black node with two red children, swap the colors.
 If X's parent is red, perform rotations, otherwise continue down the tree
- The rotations are done **while traversing down the tree** to the insertion point.
 - Avoid rotating into case (c) (2 red siblings) altogether.
- Top-Down insertion can be done with loops without recursion or parent pointers, so is slightly faster.

Insertion summary

- Rotate when an insertion or color flip produces two successive red nodes.
- Rotations are just like those for AVL trees:
 - If the two red nodes are both left children or both right children, perform a *single rotation*.
 - Otherwise, perform a *double rotation*.
- Except we recolor nodes instead of adjusting their heights or balance codes.

Testing

- 1. Insert: 1, 2, 3, 4, 5, 6, 7, 8
- 2. Insert: 7, 6, 5, 4, 3, 2, 1, 1
 - Relationship with (1)?
 - Duplicates not inserted.
- 3. Insert: 10, 85, 15, 70, 20, 60, 30, 50, 65, 80, 90, 40, 5, 55
- 4. Use applet [linked to in Schedule for today] to check your work.

Summary

• Java uses:

- Slightly faster than AVL trees
- What's the catch?
 - Need to maintain pointers to lots of nodes (child, parent, grandparent, greatgrandparent, great-greatgrandparent)
 - The deletion algorithm is *nasty*.

java.util

Class TreeMap<K,V>

java.lang.Object

java.util.AbstractMap<K,V> java.util.TreeMap<K,V>

Type Parameters:

 $\ensuremath{\kappa}$ - the type of keys maintained by this map

 $\ensuremath{\mathbb V}$ - the type of mapped values

All Implemented Interfaces:

Serializable, Cloneable, Map<K,V>, NavigableMap<K,V

public class TreeMap<K,V>
extends AbstractMap<K,V>
implements NavigableMap<K,V>, Cloneable, Se

A Red-Black tree based NavigableMap implementation. T

This implementation provides guaranteed log(n) time cost fc
