CSSE 230

Extended Binary Trees Recurrence relations

After today, you should be able to... ... explain what an extended binary tree is ... solve simple recurrences using patterns

Reminders/Announcements

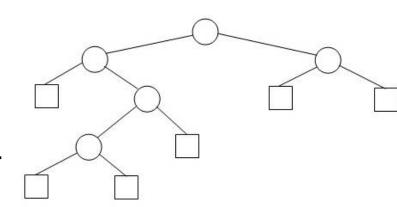

- Today:
 - Extended Binary Trees (on HW9)
 - Recurrence relations, part 1
- GraphSurfing Milestone 2
 - Two additional methods: shortestPath(T start, T end) and stronglyConnectedComponent(T key)
 - Tests on Living People subgraph of Wikipedia hyperlinks graph
 - Bonus problem: find a "challenge pair"
 - Pair with as-long-as-possible shortest path

Extended Binary Trees (EBTs)

Bringing new life to Null nodes!

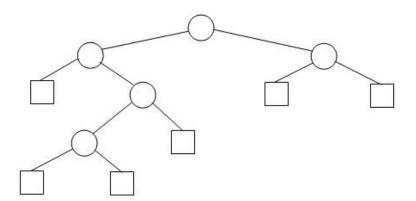

An Extended Binary Tree (EBT) just has null external nodes as leaves

- Not a single NULL_NODE, but many NULL_NODEs
- An Extended Binary tree is either
 - an *external (null) node*, or
 - an (internal) root node and two EBTs T_I and T_R.
- Convention. Internal nodes are circles; external nodes are squares.
- This is simply an alternative way of viewing binary trees: external nodes are "places" where a search can end or an element can be inserted.

A property of EBTs

- Property P(N): For any N>=0, any EBT with N internal nodes has _____ external nodes.
- Prove by strong induction, based on the recursive definition.
 - A notation for this problem: IN(T), EN(T)

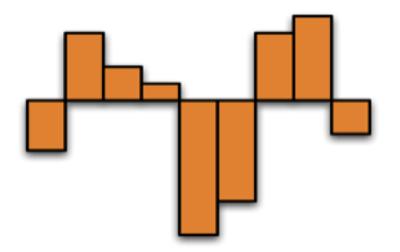

Hint (reminder): Find a way to relate the properties for larger trees to the property for smaller trees.

Introduction to Recurrence Relations

A technique for analyzing recursive algorithms

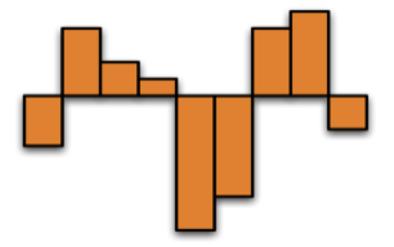

Recap: Maximum Contiguous Subsequence Sum problem

Problem definition: Given a non-empty sequence of n (possibly negative) integers $A_1, A_2, ..., A_n$, find the maximum consecutive subsequence $S_{i,j} = \sum_{k=i}^{j} A_k$, and the corresponding values of i and j.

Divide and Conquer Approach

- Split the sequence in half
- Where can the maximum subsequence appear?
- Three possibilities :
 - entirely in the first half,
 - entirely in the second half, or
 - begins in the first half and ends in the second half

This leads to a recursive algorithm

- Using recursion, find the maximum sum of first half of sequence
- Using recursion, find the maximum sum of second half of sequence
- 3. Compute the max of all sums that begin in the first half and end in the second half
 - (Use a couple of loops for this)
- 4. Choose the largest of these three numbers

```
private static int maxSumRec( int [ ] a, int left, int right )
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;
                                                   N = array size
    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;
    int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );
    for( int i = center; i >= left; i-- )
                                                   What's the
        leftBorderSum += a[ i ];
                                                    run-time?
        if( leftBorderSum > maxLeftBorderSum )
            maxLeftBorderSum = leftBorderSum;
    for ( int i = center + 1; i \le right; i++ )
        rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
           maxRightBorderSum = rightBorderSum;
    return max3 ( maxLeftSum, maxRightSum,
                 maxLeftBorderSum + maxRightBorderSum );
```

```
private static int maxSumRec( int [ ] a, int left, int right )
   int maxLeftBorderSum = 0, maxRightBorderSum = 0;
   int leftBorderSum = 0, rightBorderSum = 0;
   int center = ( left + right ) / 2;
   if( left == right ) // Base case
       return a[ left ] > 0 ? a[ left ] : 0;
   int maxLeftSum = maxSumRec( a, left, center );
   int maxRightSum = maxSumRec( a, center + 1, right );
    for( int i = center; i >= left; i-- )
                                               Runtime =
       leftBorderSum += a[ i ];
                                               Recursive part +
       if( leftBorderSum > maxLeftBorderSum )
                                               non-recursive part
           maxLeftBorderSum = leftBorderSum;
    for( int i = center + 1; i <= right; i++ )</pre>
       rightBorderSum += a[ i ];
       if( rightBorderSum > maxRightBorderSum )
           maxRightBorderSum = rightBorderSum;
   return max3 ( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
```

Analysis?

- Write a Recurrence Relation
 - T(N) gives the run-time as a function of N
 - Two (or more) part definition:
 - Base case, like T(1) = c
 - Recursive case,like T(N) = T(N/2) + 1

So, what's the recurrence relation for the recursive MCSS algorithm?

```
private static int maxSumRec( int [ ] a, int left, int right )
   int maxLeftBorderSum = 0, maxRightBorderSum = 0;
   int leftBorderSum = 0, rightBorderSum = 0;
   int center = ( left + right ) / 2;
   if( left == right ) // Base case
       return a[ left ] > 0 ? a[ left ] : 0;
   int maxLeftSum = maxSumRec( a, left, center );
   int maxRightSum = maxSumRec( a, center + 1, right );
    for( int i = center; i >= left; i-- )
                                               Runtime =
                                               Recursive part +
       leftBorderSum += a[ i ];
       if( leftBorderSum > maxLeftBorderSum )
                                               non-recursive part
           maxLeftBorderSum = leftBorderSum;
    for( int i = center + 1; i <= right; i++ )</pre>
       rightBorderSum += a[ i ];
       if( rightBorderSum > maxRightBorderSum )
           maxRightBorderSum = rightBorderSum;
   return max3 ( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
```

```
10
```

```
private static int maxSumRec( int [ ] a, int left, int right )
    int maxLeftBorderSum = 0, maxRightBorderSum = 0;
    int leftBorderSum = 0, rightBorderSum = 0;
    int center = ( left + right ) / 2;
    if( left == right ) // Base case
        return a[ left ] > 0 ? a[ left ] : 0;
   int maxLeftSum = maxSumRec( a, left, center );
    int maxRightSum = maxSumRec( a, center + 1, right );
    for( int i = center; i >= left; i-- )
                                               Runtime =
                                               Recursive part +
       leftBorderSum += a[ i ];
        if( leftBorderSum > maxLeftBorderSum )
                                                non-recursive part
           maxLeftBorderSum = leftBorderSum;
    for( int i = center + 1; i <= right; i++ )</pre>
       rightBorderSum += a[ i ];
        if( rightBorderSum > maxRightBorderSum )
                                                   2T(N/2) + \theta(N)
           maxRightBorderSum = rightBorderSum;
    return max3 ( maxLeftSum, maxRightSum,
                maxLeftBorderSum + maxRightBorderSum );
```

Recurrence Relation, Formally

- An equation (or inequality) that relates the nth element of a sequence to certain of its predecessors (recursive case)
- Includes an initial condition (base case)
- **Solution:** A function of n.

- Similar to differential equation, but discrete instead of continuous
- Some solution techniques are similar to diff. eq. solution techniques

Solve Simple Recurrence Relations

- One strategy: look for patterns
 - Forward substitution
 - Backward substitution
- Examples:

As class:

```
\circ T(0) = 0, T(N) = 2 + T(N-1)
```

- \cdot T(0) = 1, T(N) = 2 T(N-1)
- T(0) = T(1) = 1, T(N) = T(N-2) + T(N-1)

On quiz:

- $\cdot T(0) = 1, T(N) = N T(N-1)$
- \circ T(0) = 0, T(N) = T(N -1) + N
- T(1) = 1, T(N) = 2 T(N/2) + N(just consider the cases where $N=2^k$)

Next time: More solution strategies for recurrence relations

- Find patterns
- Telescoping
- Recurrence trees
- The master theorem
