Plan for Today

- ❖ **Summarize 2/3-term Course Evaluation**
- ❖ **Domain Model Refinements**
- ❖ **Iteration 3**

+/ ∂ Feedback: Lectures

Pace

- 1 – much too fast
- 14 – somewhat too fast
- 2 – Somewhat too slow
- 0 – much too slow

Working well

- Group/interactive examples (3)
- In-class activities (5)
- Diagrams on board (3)
- Right pace and right slides (2)
- In-class examples from project
- Integr. of slides-quiz-exercises
- Helping me learn topics better
- Everything

Improvements

- Choose better examples—explain them more fully (2)
- More group/interactive examples (2)
- More specific reasons behind pattern & design
- Move quiz quest.# to page top
- Less text on slides
- Stop lecturing—teach us the info—tell us only what we need to know
- Keep on improving!

+/ ∂ Feedback: Quizzes

Quizzes

- 8 – Very helpful
- 8 – somewhat helpful
- 1 – somewhat unhelpful
- 0 – Very unhelpful

Working well

- Focuses lecture for me (9)
- Indicates high points (4)
- Integration with material (6)
- Questions work well (2)
- Sufficient time to answer
- Good study guide

Improvements

- Provide answers (3)
 - Easier questions (2)
- ↕
- More challenging questions (2)
 - Less fill-in blank
 - Make questions even shorter
 - Less goofy (unicorn) questions
 - Random questions too random
 - Leave general definitions out

+/ ∂ Feedback: Reading and Homework

Reading

1 – all of it

2 – most of it

12 – little of it

2 – none of it

Homework Difficulty

3 – much too difficult

13 – a bit too difficult

1 – a bit too easy

0 – much too easy

+/ ∂ Feedback: Homework Helpfulness

Homework Helpfulness

- 3 – very helpful**
- 8 – somewhat helpful**
- 4 – somewhat unhelpful**
- 2 – very unhelpful**

Working well

- Helpful for Milestones (4)**
- Re-enforces class material (7)**
- Challenging to learn more (2)**
- Good feedback (3)**
- Good examples**
- Instruction have improved**
- Homeworks have been a great help in this class**

Improvements

- Even specific instructions (4)**
- Provide even more examples to clarify assignments (3)**
- Simplify project/homework (2)**
- Redo's on HW below 8/10**
- Shorten them—too much time**
- Do away with homework**

+/ ∂ Feedback: Workload

❖ Workload

- 2** – much higher than average
- 12** – somewhat higher than average
- 3** – somewhat lower than average
- 0** – much lower than average

❖ General Comments

- Things were just about right (3)**
- A lot of information, some irrelevant (2)**
- DeDS not good, but gone**
- Change slide template**
- Thank for not reading XKCD in class**
- Class has improved (2)**

Summary of +/- Actions

- ❖ More active learning
- ❖ More examples done on board
- ❖ Focus more on Project
- ❖ Keep improving quizzes
- ❖ Continue to better clarify assignments

Domain Model Refinement

Recall: Techniques for identifying conceptual classes

- ❖ **Conceptual category lists**
- ❖ **Noun phrase identification**
- ❖ **Existing domain models**

Conceptual Category List on NextGen POS, Iteration 3

Category	Examples
physical or tangible objects	<i>CreditCard, Check</i>
transactions	<i>CashPayment, CreditPayment, CheckPayment</i>
other systems external to ours	<i>CreditAuthorizationService, CheckAuthorizationService</i>
organizations	<i>CreditAuthorizationService, CheckAuthorizationService</i>
records of finance, work, contracts, legal matters	<i>AccountsReceivable</i>

Noun Phrase Identification on NextGen POS, iteration 3

Payment Authorization Request

Credit Account Information

Payment Authorization Service

Payment Approval

Use Case UC1: Process Sale

Extensions:

7a. Paying by credit:

1. Customer enters their **credit account information**.
2. System sends **payment authorization request** to an external **Payment Authorization Service System**, and requests **payment approval**.
- 2a. System detects failure to collaborate with external system:
 1. System signals error to Cashier.
 2. Cashier asks Customer for **alternate payment**.
3. System receives **payment approval** and signals approval to Cashier.
- 3a. System receives **payment denial**:
 1. System signals denial to Cashier.
 2. Cashier asks Customer for **alternate payment**.
4. System records the **credit payment**, which includes the payment approval.
5. System presents credit payment signature **input mechanism**.
6. Cashier asks Customer for a **credit payment signature**. Customer enters signature.

7c. Paying by check:

1. The Customer writes a **check**, and gives it and their **driver's license** to the Cashier.
2. Cashier writes the driver's **license number** on the check, enters it, and requests **check payment authorization**.
3. Generates a **check payment request** and sends it to an external **Check Authorization Service**.
4. Receives a **check payment approval** and signals approval to Cashier.
5. System records the **check payment**, which includes the payment approval.

...

Generalization-Specialization Class Hierarchy

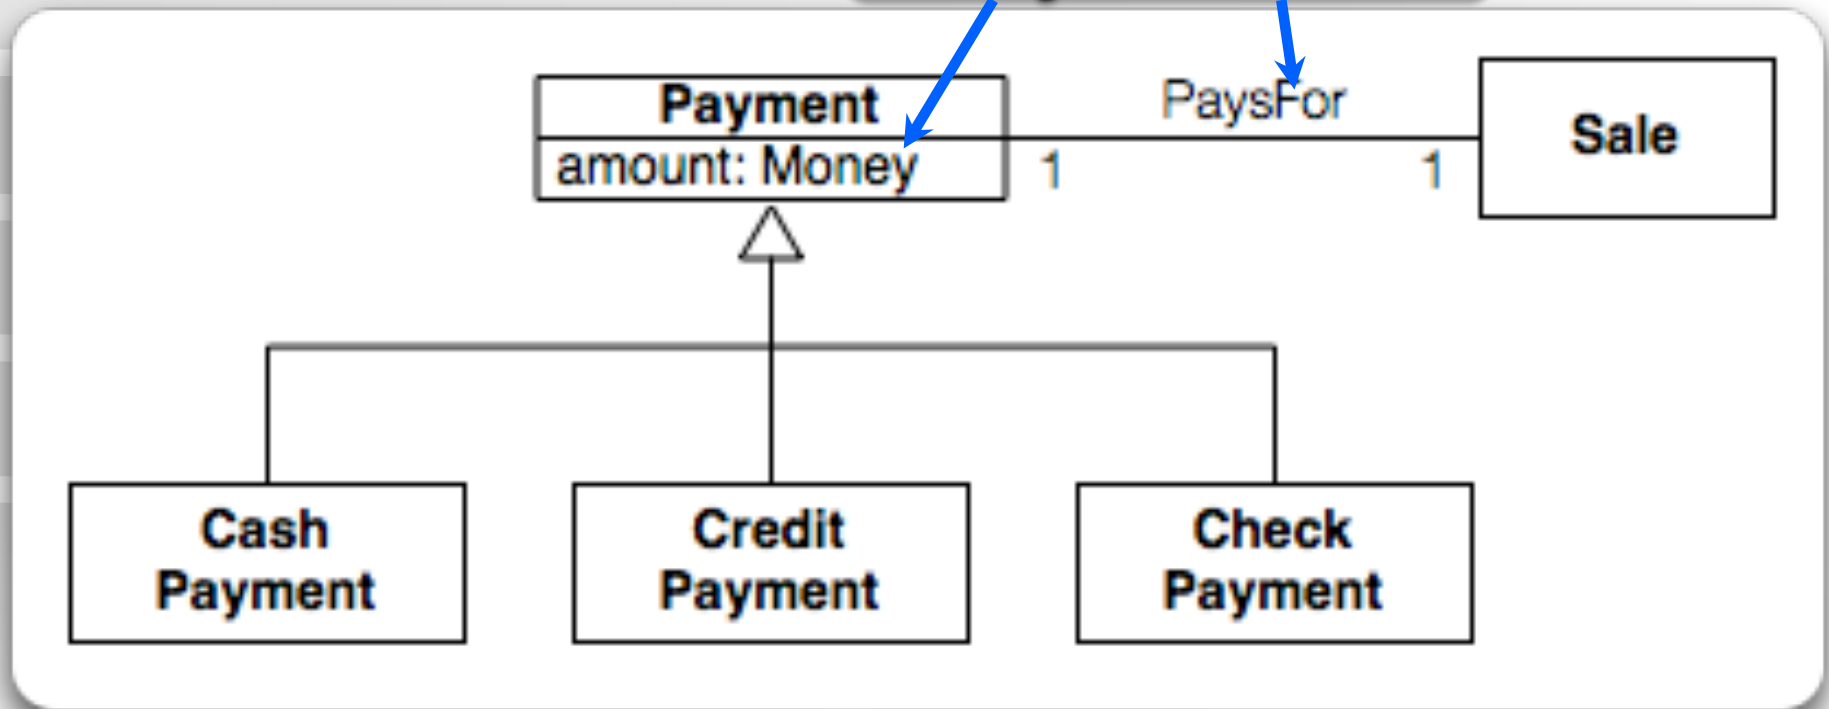

Why? Can understand concepts in more general terms.
Payment gives our brains less to deal with.

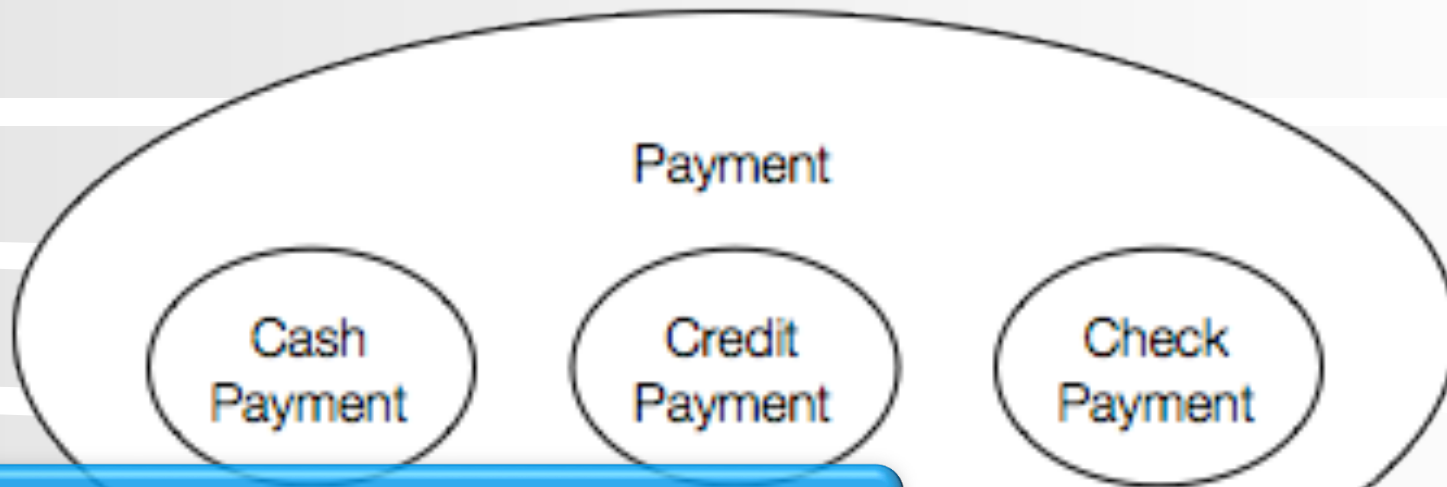

- ❖ Conceptual classes, not software classes
- Domain modeling!
- ❖ *Generalization*: finding commonalities among concepts
 - *Superclass*: general concept
 - *Subclass*: specialized concept

Generalization

Common features of Payments

Generalizations and Sets

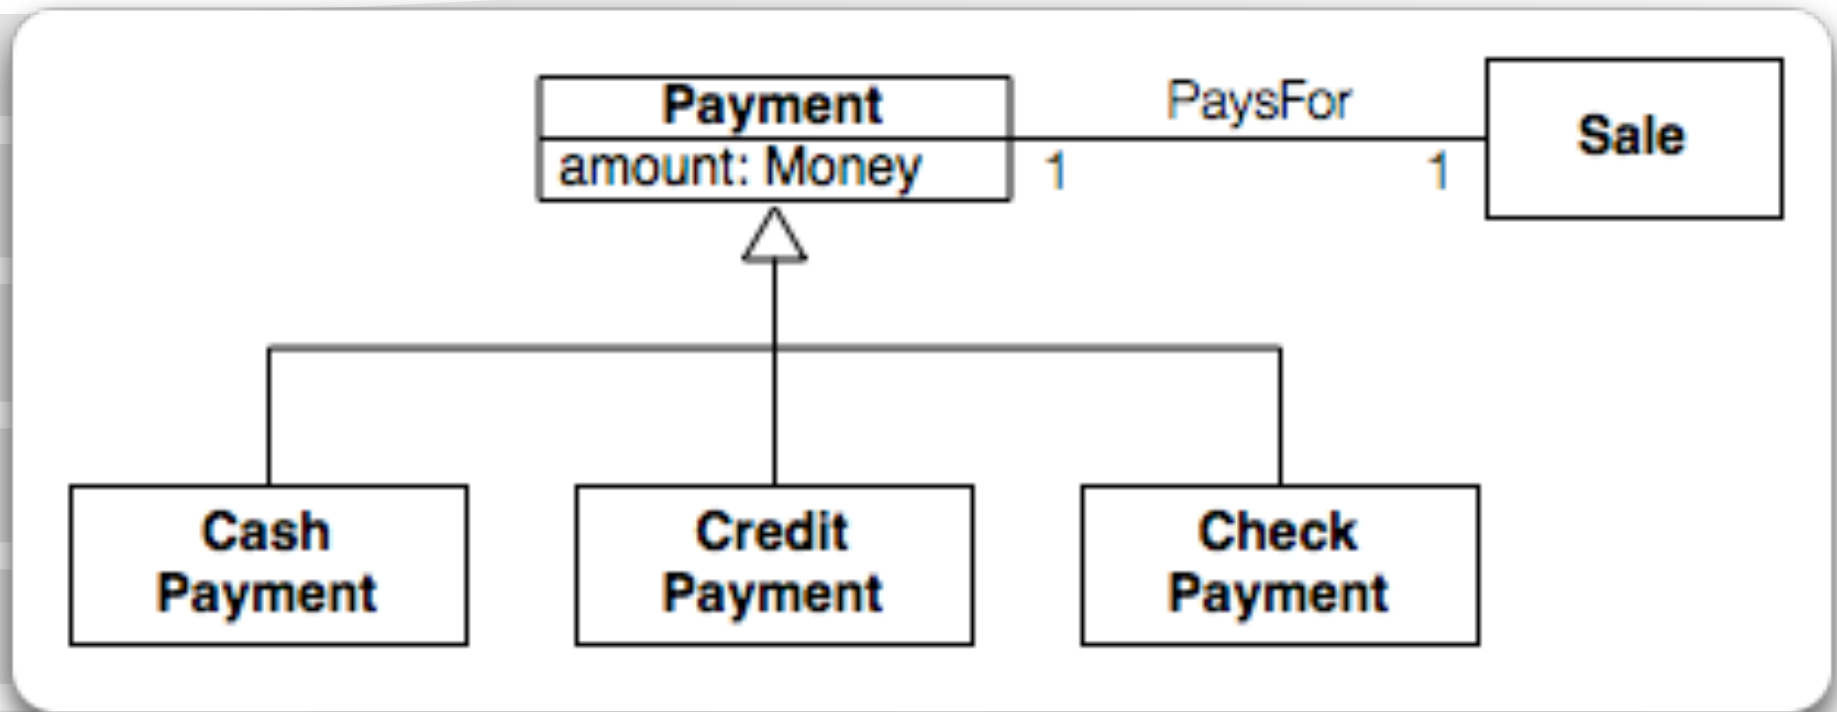

Is-a rule: Subclass *is a* superclass, e.g., CashPayment *is a* Payment

All members of a conceptual subclass set are members of their superclass set

Subclass Conformance—The 100% Rule

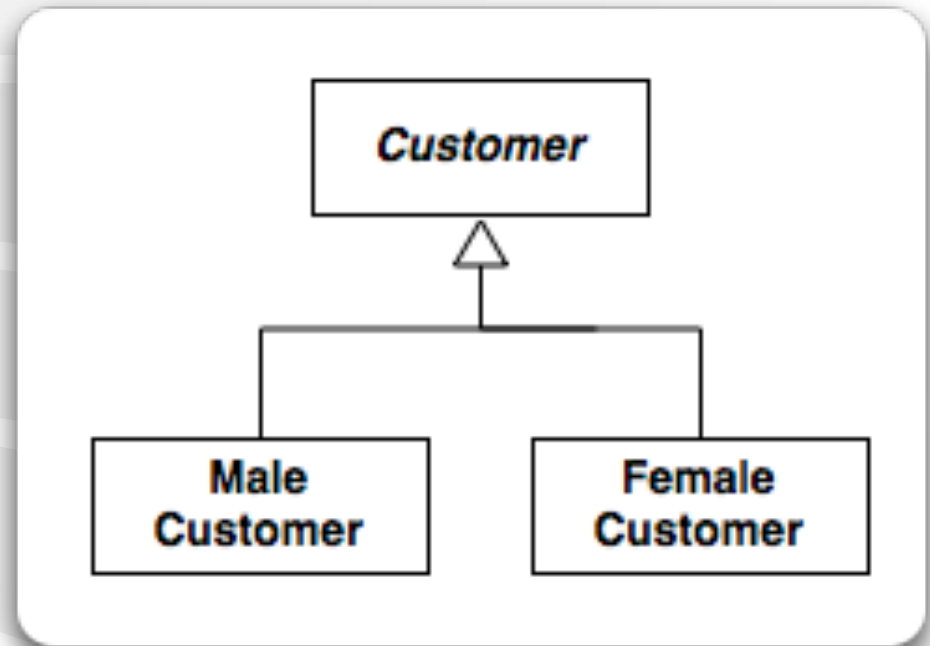

The subclass must conform to all of the superclass's *attributes* and *associations*.

When should we define a Conceptual Subclass?

Does this make sense...

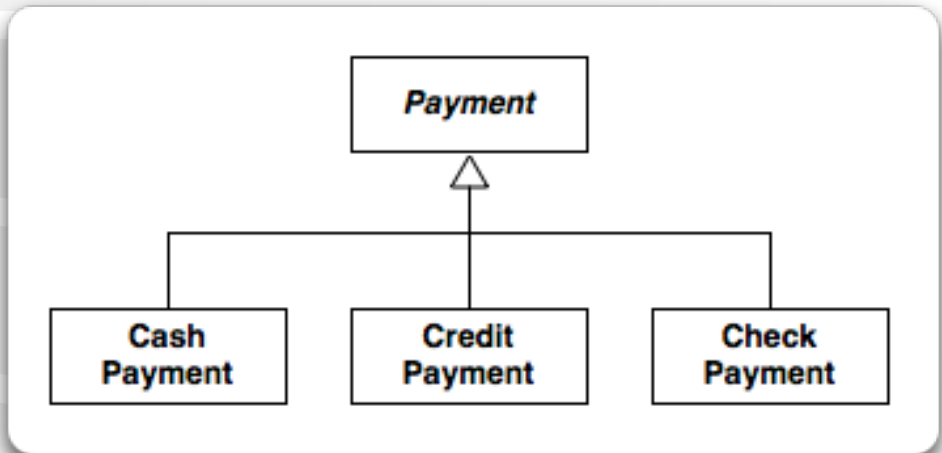

- for NextGen POS?
- for other domains?

When should we define a Conceptual Subclass? (continued)

When the subclass...

- has additional attributes
- has additional associations
- is operated on or handled differently
- represents an animated thing that behaves differently

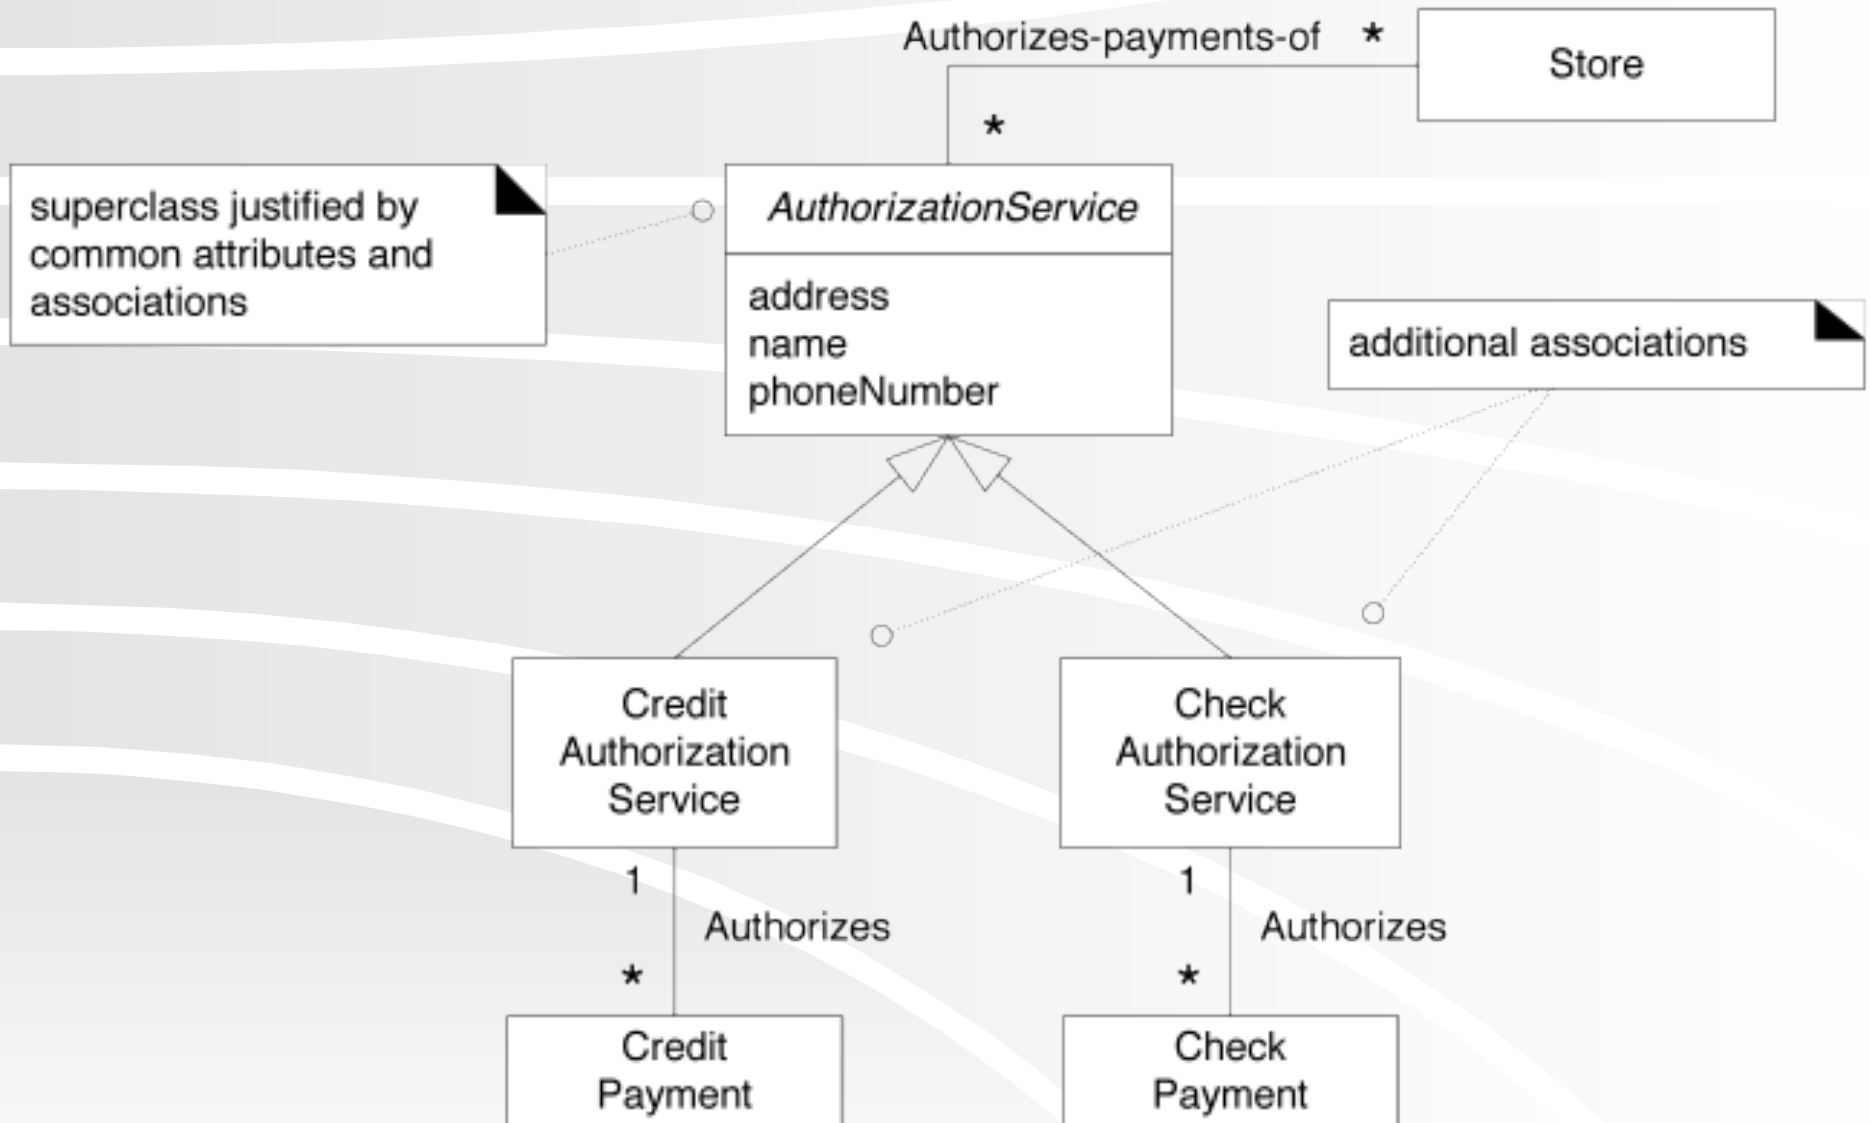

Which of these apply here?

When should we group classes and extract a superclass?

Create a superclass when:

1. Potential *subclasses represent variations* of a similar concept
(e.g., Video, Game → RentableItem)
2. Subclasses will conform to *100% and is-a rules*
3. There are *common attributes or associations* that could be pulled into superclass

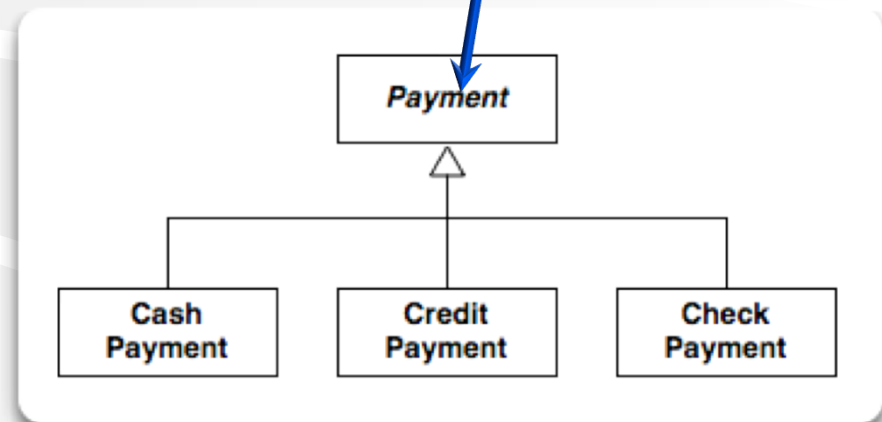

Another Example

Abstract Conceptual Classes

If every member of a class C must be a member of a subclass, then C is an *abstract conceptual class*

Italics (or {abstract} keyword) indicate abstract class

What does this mean in terms of our set idea?

Thinking Ahead...

Work in teams on Q4

Homework and Milestone Reminders

- ❖ **Read Chapter 31 (rest)**
- ❖ **Homework 7– Gang of Four (GoF) Patterns on Video Store Design**
 - **Due by 5:00pm Tuesday, February 2nd, 2010**
