

## Analysis of algorithms

### Issues:

- correctness
- time efficiency
- space efficiency
- optimality

### Approaches:

- theoretical analysis
- empirical analysis

## Best-case, average-case, worst-case

For some algorithms efficiency depends on form of input:

- Worst case:  $C_{\text{worst}}(n)$  – maximum over inputs of size  $n$
- Best case:  $C_{\text{best}}(n)$  – minimum over inputs of size  $n$
- Average case:  $C_{\text{avg}}(n)$  – “average” over inputs of size  $n$ 
  - Number of times the basic operation will be executed on typical input
  - NOT the average of worst and best case
  - Expected number of basic operations considered as a random variable under some assumption about the probability distribution of all possible inputs

## Example: Sequential search

**ALGORITHM** *SequentialSearch*( $A[0..n-1], K$ )

//Searches for a given value in a given array by sequential search

//Input: An array  $A[0..n-1]$  and a search key  $K$

//Output: The index of the first element of  $A$  that matches  $K$

// or  $-1$  if there are no matching elements

$i \leftarrow 0$

**while**  $i < n$  **and**  $A[i] \neq K$  **do**

$i \leftarrow i + 1$

**if**  $i < n$  **return**  $i$

**else return**  $-1$

✦ **Worst case**

✦ **Best case**

✦ **Average case**

3

## Asymptotic order of growth

A way of comparing functions that ignores constant factors and small input sizes

✦  $O(g(n))$ : class of functions  $f(n)$  that grow no faster than  $g(n)$

✦  $\Theta(g(n))$ : class of functions  $f(n)$  that grow at same rate as  $g(n)$

✦  $\Omega(g(n))$ : class of functions  $f(n)$  that grow at least as fast as  $g(n)$

A. Levitin "Introduction to the Design & Analysis of Algorithms," 3rd ed., Ch. 2

7

## Establishing order of growth using the definition

**Definition:**  $f(n)$  is in  $O(g(n))$  if order of growth of  $f(n) \leq$  order of growth of  $g(n)$  (within constant multiple), i.e., there exist positive constant  $c$  and non-negative integer  $n_0$  such that

$$f(n) \leq c g(n) \text{ for every } n \geq n_0$$

**Examples:**

•  $10n$  is  $O(n^2)$

•  $5n+20$  is  $O(n)$

A. Levitin "Introduction to the Design & Analysis of Algorithms," 3rd ed., Ch. 2

8

## Establishing order of growth using limits

$$\lim_{n \rightarrow \infty} T(n)/g(n) = \begin{cases} 0 & \text{order of growth of } T(n) < \text{order of growth of } g(n) \\ c > 0 & \text{order of growth of } T(n) = \text{order of growth of } g(n) \\ \infty & \text{order of growth of } T(n) > \text{order of growth of } g(n) \end{cases}$$

## Examples:

•  $10n$  vs.  $n^2$

•  $n(n+1)/2$  vs.  $n^2$

9

## Time efficiency of nonrecursive algorithms

## General Plan for Analysis

- ◆ Decide on parameter  $n$  indicating input size
- ◆ Identify algorithm's basic operation
- ◆ Determine worst, average, and best cases for input of size  $n$
- ◆ Set up a sum for the number of times the basic operation is executed
- ◆ Simplify the sum using standard formulas and rules (see Appendix A)

A. Levitin "Introduction to the Design & Analysis of Algorithms," 3rd ed., Ch. 2

10

## Useful summation formulas and rules

$$\sum_{1 \leq i \leq u} 1 = 1 + 1 + \dots + 1 = u - 1 + 1$$

In particular,  $\sum_{1 \leq i \leq n} 1 = n - 1 + 1 = n \in \Theta(n)$

$$\sum_{1 \leq i \leq n} i = 1 + 2 + \dots + n = n(n+1)/2 \approx n^2/2 \in \Theta(n^2)$$

$$\sum_{1 \leq i \leq n} i^2 = 1^2 + 2^2 + \dots + n^2 = n(n+1)(2n+1)/6 \approx n^3/3 \in \Theta(n^3)$$

$$\sum_{0 \leq i \leq n} a^i = 1 + a + \dots + a^n = (a^{n+1} - 1)/(a - 1) \text{ for any } a \neq 1$$

In particular,  $\sum_{0 \leq i \leq n} 2^i = 2^0 + 2^1 + \dots + 2^n = 2^{n+1} - 1 \in \Theta(2^n)$

$$\sum (a_i \pm b_i) = \sum a_i \pm \sum b_i \quad \sum c a_i = c \sum a_i \quad \sum_{1 \leq i \leq n} a_i = \sum_{1 \leq i \leq m} a_i + \sum_{m+1 \leq i \leq n} a_i$$

11

## Example 1: Maximum element

**ALGORITHM** *MaxElement*( $A[0..n-1]$ )

//Determines the value of the largest element in a given array

//Input: An array  $A[0..n-1]$  of real numbers

//Output: The value of the largest element in  $A$

$maxval \leftarrow A[0]$

**for**  $i \leftarrow 1$  **to**  $n - 1$  **do**

**if**  $A[i] > maxval$

$maxval \leftarrow A[i]$

**return**  $maxval$

A. Levitin "Introduction to the Design & Analysis of Algorithms," 3rd ed., Ch. 2

12

## Example 2: Element uniqueness problem

**ALGORITHM** *UniqueElements*( $A[0..n-1]$ )

//Determines whether all the elements in a given array are distinct

//Input: An array  $A[0..n-1]$

//Output: Returns “true” if all the elements in  $A$  are distinct

// and “false” otherwise

**for**  $i \leftarrow 0$  **to**  $n-2$  **do**

**for**  $j \leftarrow i+1$  **to**  $n-1$  **do**

**if**  $A[i] = A[j]$  **return false**

**return true**

13

## Example 3: Matrix multiplication

**ALGORITHM** *MatrixMultiplication*( $A[0..n-1, 0..n-1]$ ,  $B[0..n-1, 0..n-1]$ )

//Multiplies two  $n$ -by- $n$  matrices by the definition-based algorithm

//Input: Two  $n$ -by- $n$  matrices  $A$  and  $B$

//Output: Matrix  $C = AB$

**for**  $i \leftarrow 0$  **to**  $n-1$  **do**

**for**  $j \leftarrow 0$  **to**  $n-1$  **do**

$C[i, j] \leftarrow 0.0$

**for**  $k \leftarrow 0$  **to**  $n-1$  **do**

$C[i, j] \leftarrow C[i, j] + A[i, k] * B[k, j]$

**return**  $C$
