

#2 i. 90% CI for $\mu = \text{avg. capacity}$:

$$\bar{x} = 178$$

$$s = 14 \Rightarrow \sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}} \approx \frac{s}{\sqrt{n}} = \frac{14}{\sqrt{120}} = 1.278$$

$$Z_{\alpha/2} = 1.645$$

$$\begin{aligned} 95\% \text{ CI: } & (\bar{x} - 1.645\sigma_{\bar{x}}, \bar{x} + 1.645\sigma_{\bar{x}}) \\ & = (178 - 1.645(1.278), 178 + 1.645(1.278)) \\ & = (175.90, 180.10) \end{aligned}$$

ii.

$$\begin{array}{ccc} 176 < \mu < 180 \\ \underbrace{\hspace{2cm}} & & \underbrace{\hspace{2cm}} \\ \bar{x} - 2 & & \bar{x} + 2 \\ \uparrow & & \uparrow \\ & \text{---} & \\ & & Z_{\alpha/2} \sigma_{\bar{x}} \end{array}$$

$$2 = Z_{\alpha/2} \sigma_{\bar{x}} \approx Z_{\alpha/2} 1.278$$

$$\therefore Z_{\alpha/2} = \frac{2}{1.278} = 1.565$$

$$\text{Since } \Phi(-Z_{\alpha/2}) = \alpha/2$$

$$\Phi(-1.565) \approx \Phi(-1.56) = .0594$$

$$\therefore 100(1-\alpha)\% = 100(1-2(.0594))\% \approx \underline{88\%}$$
